glazes, in mottle effects and in numerous styles of relief and decoration to harmonise with the interior tiles, and raised bevel panels in a plain enamel glaze to blend with the colouring of the background and giving the mantel a bold and impressive appearance. All returns are carried on the tiles themselves, which will at once appear a distinct advantage over small corner beads, obviating all the difficulties that used to be associated with them. "Grip"-back tiles are used throughout these fireplaces, making it impossible for the tiles to come away from the cement. The surround is slabbed in one piece, as also is the mantel and the shelf, the former being soffited into the latter when fixed into position. The mantels are made to overlap the surround 3/4-inch and with a face projection of 1 1/4-inch. This new departure will doubtless be welcomed by architects, builders and the general public alike, as these tile mantels give a completeness and unity to a fireplace that is

distinctly pleasing. The block shown represents another new line that this firm are introducing; it consists of a slabbed-tile panel into which is flanged a faience shelf or hob, which will be found a great convenience for holding a teapot, or in the summer time a plant or flower vase. These hobs can be introduced in almost any pattern of panel and in colourings to match, and we think will commend themselves as a distinct novelty.

**BUILDING AND BUILDERS.**

THE Court of Common Council have adopted a report from the Bridge House Estates committee asking for authority to accept the tender of Messrs. Beaumont & Sons at 4,948*l.* 7*s.* for repainting the Tower Bridge.

A DAUGHTER of a Leicester builder recently climbed a chimney 150 feet high which is being constructed at one of the Corporation reservoirs. She mounted the outside ladders, and, having reached the top, walked round the edge of the scaffolding platform. This is her second feat of the kind during the week. The builder challenges his daughter against any girl under eighteen for climbing high chimneys and steeples.

THE Cumberland education committee have accepted tenders for the erection of three schools, viz. Whitehaven secondary school, Messrs. Hughes & Stirling, Bootle, Liverpool, 10,416*l.*; Carlisle girls', Messrs. J. & R. Bell, Nelson Street, Carlisle, 11,629*l.*; Brampton, Mr. John Heward, Brampton, 2,920*l.* Messrs. Grayson & Ould, architects, Liverpool, have been asked to report upon plans for the Alston school, sent in by Messrs. Moffatt & Bentley, Whitehaven; Messrs. Oliver & Dodgshun, Carlisle; Mr. H. Higginson, Carlisle; and Mr. T. Taylor Scott, Carlisle.

MR. W. HEMINGWAY MILLS, M.I.C.E., the arbitrator appointed to assess the purchase money of the Waterford toll bridge, which is sought to be purchased by the Waterford Corporation, has made his award. It is practically a confirmation of the previous award of 63,000*l.*, but the arbitrator further awards the bridge proprietors 35*o*l. costs against the Corporation. As neither the Bridge Commissioners nor the Corporation are satisfied with the award an appeal is considered inevitable.

At the Leeds Assizes on the 25th ult., before Mr. Justice Grantham and a special jury, Mrs. Gourlay, of Harrogate, sought an injunction to restrain a builder, of Harrogate, from working a mortar mill on land near her house. For the plaintiff it was said the mortar mill was erected two or three years ago. It caused such a noise and vibration that she complained of the nuisance and for a time the defendant ceased to use it. In April 1905 the mill was again used and was stopped when the plaintiff complained. In November 1906, however, the mill was started again and it was worked until March. The plaintiff related how on one

occasion a clergyman called at her house about some in which they were mutually interested, and they were unable to continue their conversation on account of noise. She was unable to get any afternoon sleep on one occasion she had to stuff her ears with cotton wool on account of the noise. The jury found for the plaintiff and granted an injunction, with costs.

THE interlocutor has been issued in connection with a charge against a Glasgow firm of joiners for all the occupancy of a house belonging to them in Finnieston Street without a certificate from the Master of Works that it was fit for occupancy. At the Court the agents for the respondents argued that the Dean of Guild Court was a competent Court to deal with such a case, and that the actions of the Master of Works had been harsh and oppressive. The Fiscal, in reply, showed that the Dean of Guild Court had the power to administer their own law and the power to punish those who went against it. The Court repelled all the defences, and fined each of the respondents 1*l.* 1*s.* for every day the house had been occupied, 3*l.* 14*s.*, and the expenses of process as such may be by the auditor of the Sheriff Court of Lanarkshire. An appeal has been intimated.

At the last meeting of the Lambeth Council it was reported that several contractors had evaded the clauses of their contracts by paying their workmen less than those scheduled in the contracts. It was decided to hold over some of the balances that were due to the contractors, and to issue the following public notice: "The Lambeth Borough Council has in its hands a sum of money forfeited to the Council under certain cartage contracts in respect of the breach of a condition of the contracts providing for the payment of a minimum wage of 1*s.* per day to all workmen engaged by the contractors for work for the Council. Notice is hereby given that the Council proposes to take into its consideration applications by any workmen employed in the Council's work by any of the contractors mentioned who may be able to prove that they were employed by either of such contractors for the Council and received less than the minimum wage of 1*s.* per day." It appears that the total amount which the Council had detained from various contractors amounted to about 1,000*l.*

ELECTRIC NOTES.

The Corporation of Manchester have given notice that and after August 1 the Corporation will only connect to their electric mains consumers' installations which have been carried out by a firm approved and registered by the electricity committee. The names and addresses of all firms on the registered list may be obtained on application to the secretary of the electricity department.

The tramways committee of the Wolverhampton Town Council recommend that a tramway be constructed from Green Square via Worcester Street to Penn Fields, on the main system. Application is to be made to the Board of Trade for consent to any alteration to the original plan as to turnouts and other matters. Tenders are to be invited for the construction of the permanent way. The estimated cost is set down at 18,300l.

At the meeting of Edmundson's Electricity Corporation, Ltd., in London the Chairman said the Lancashire Power Construction Company, Ltd., which belonged to them, was the only company at present from which they got no return, but eventually he believed it would be one of the best, as there were plenty of openings in Lancashire for electrical enterprise. A great many towns were using more electricity for power than for lighting. The latter had been very much checked by the invention of the gas incandescent lamp, but a new mantle had been invented for the electric lamp which would practically treble its lighting power and reduce the cost.

At the West Hartlepool County Court, Judge O'Connor spent seven hours hearing a case in which the owner and occupier of a house and shop in Penrith Street, Hartlepool, claimed 75l. damages from the Northern Counties Electricity Supply Company. The plaintiff alleged that the noise and vibration from the power-house which the company had erected at the back of Penrith Street caused considerable annoyance, and also had damaged his premises. The Judge awarded 10l. for annoyance and nothing for structural damage. Other similar claims were adjourned.

EXPERIMENTS in methods of street lighting have been arranged by the public health department of the City of London for the purpose of proving the best form of street illumination. The City of London Electric Lighting Co. will demonstrate on the Holborn Viaduct by means of flame arc lamps, in Farringdon Street by enclosed arc lamps, and in Newgate Street by smaller arc lamps, the charges to be at the rate of 17l. 10s. each, instead of the existing charge of 26l. per lamp, and a considerable reduction for the smaller lamps. The Charing Cross, West End and City Electric Lighting Company will demonstrate in Cannon Street by means of centrally-hung flame arc lamps at a cost of 17l. 10s.

DR. A. W. BRIGHTMORE, an inspector of the Local Government Board, held an inquiry at the Manchester town hall recently into an application by the electricity committee of the Corporation for sanction to borrow 112,850l. for the purposes of the electricity undertaking. The loan was needed partly to provide new machinery at the Dickinson Street and Bloom Street stations, and also at the Stuart Street station, for purposes of economy. For these works 5,752l. was required. For mains a sum was required of 60,498l., for transforming plant at sub-stations on consumers' premises 32,000l., and for additional plant at the Corporation distributing stations 14,600l., making up the total to 112,850l.

THE Rawtenstall Town Council have decided to apply to the Local Government Board for power to borrow 29,000l. for providing an electricity generating station at Hareholme, and the mains and equipment for a general electricity supply for the borough, including a supply for tramway purposes. Messrs. Lacey, Sillar & Leigh, electrical engineers, have been asked to prepare the necessary plans

Weighbridges and Weighing Machinery

and estimates of the cost. It has also been decided to offer a certain price to the Rossendale Valley Tramways Company for their undertaking, which is to be electrified by the Rawtenstall Corporation. The Corporation has declined to fall in with a proposal from the Bacup Corporation that the three boroughs of Bacup, Rawtenstall and Haslingden should combine in purchasing electricity in bulk from a private company.

THE London County Council adopted last week the proposal of the highways committee that as an experiment the tramways between Aldgate and Bow be reconstructed on the "G. B." system of surface contact electric traction. In the committee's report it was pointed out that owing to special difficulties on the part of this route its electrification on the conduit system would entail a very heavy expenditure, while the Stepney Borough Council had opposed a proposal to reconstruct a portion of the line on the overhead system. It was calculated that the total cost of the trackwork of the whole length of about six miles of line would be about 66,000*l.*, or 11,000*l.* a mile of single track, compared with about 19,000*l.* a mile single track which it was estimated would be involved by the adoption on this particular route of the conduit system.

An electric-power installation of interest to all power users has been completed at the Cambrian Collieries, situated in Clydach Vale, South Wales. About three years ago the management of the three mines owned by the company, employing about 3,500 men, producing a million tons of coal per annum, resolved upon an experimental installation of electricity for working haulages, coal-cutting machinery, pumps and other underground purposes. The experiment proving satisfactory, the company decided to have a complete installation practically for all purposes, and to erect a power station for the production of their own current. Tenders were invited, and the result was that Messrs. Siemens Brothers, Dynamo Works, Ltd., London and Stafford, secured the contract, and the work is now completed. In the engine-room space is provided for three generating sets. At present the generating plant consists of two Siemens-Belliss and Morcom sets.

MR. A. G. DRURY, on behalf of the Local Government Board, held an inquiry at Wolverhampton on the 23rd ult.

with regard to an application by the Town Council to sanction to borrow 35,000*l.* for their electricity undertaking. The town clerk said the money was required to extend the generating station, erect new boilers, put in plant and extend the mains. The Town Council entered into a contract to supply Messrs. Bayliss, Jones & Bayliss with electricity to be used at their works at more Green. This will involve an expenditure of 16,000*l.* on generating plant. In addition, the Corporation will have to cope with the general increased demand for electricity is proposed to provide four more boilers—the boiler will have to be enlarged—and four more generating with a capacity of 4,000 kilowatts, and water-tube boiler with an evaporative capacity of 20,000 lbs. per hour. electricity will be transmitted to Messrs. Bayliss, Jones & Bayliss's works, where it will be transformed. The clerk asked that the repayment of the loan should be on the longest possible terms.

#### VARIETIES.

MR. ROBERT MORRISON, builder, of Wavertree, Liverpool, senior partner of the firm of Messrs. Morrison & Sons, died June 10, intestate, aged sixty-two, left estate valued at 60,285*l.* gross, with net personalty 48,219*l.*

THE Coventry education committee have decided to purchase land at a cost of 2,500*l.* for extension of technical institute, and the city engineer was instructed to prepare plans for the proposed extension. It was decided to recommend the Council to build a new elementary school at Leicester Causeway, at an estimated cost of 18,000*l.*

WE have received a copy of "Where to Stay and What to See," published by Mr. Walter Hill, of 67 and 69 Southampton Row, London, W.C. An almost exhaustive list is given of seaside, farmhouse and country lodge hotels and boarding-houses, in the districts served by Midland, London and North-Western, Great Central, Great Northern, Great Eastern and Great Western railways. The work is well printed and illustrated, and can be obtained for the modest sum of 1*s.* at any of the railway stations, or from the companies mentioned, or from the publisher by post for 6*d.* extra.

Continuation North of Tottenham Road

A PUBLIC meeting has been held at Rusholme, Manchester, to further the movement for the preservation of the fields as an open space. A resolution was passed unanimously in favour of asking the Corporation to buy the land for public use. The opinion of all who spoke was that it would be deplorable if the estate, with its fine trees, were allowed to go to the speculative builder.

A PETITION, with accompanying plans, was presented in Milton Dean of Guild Court last week for the erection of a hippodrome at the corner of Townhead Street and Lowwick Street. The plans were submitted by Mr. E. H. Lock, the Zoo, Glasgow. There is a large auditorium gallery, with a full-sized stage. The accommodation is 1,350, and the estimated cost is about 5,000*l*. The plans were found to be all in order, but before formally passing a week's continuation was agreed to to permit of the City Commissioners holding a special meeting to consider as to a probable street improvement at the site.

THE Old Bailey site was put up for auction at the Mart, Cannonhouse Yard, on Monday by Messrs. Jones, Lang & Co. to be let on a building lease for ninety-nine years. The land was offered in three lots. Lot 1, having an area of 709 feet, started at 500*l*. It rose by 100*l*. bids to 700*l*, it was knocked down at an annual rental of 800*l*. Lot 2, with an area of 5,062 feet, commenced at 500*l*, and rose by bids of 50*l*., 25*l*., 10*l*. and 5*l*. to 650*l*., being knocked down at the latter figure. Lot 3 contained an area of 314 feet, and on this portion of the site the auctioneer announced that a part of Old London Wall still stands. No bid higher than 625*l*. was forthcoming, and the lot was withdrawn.

QUARRYING at the Abbey Craig, Stirling, was stopped by an agitation against the taking of rock from the quarry, which, it was stated, was disfiguring the effect of the Wallace Monument. The Secretary for Scotland has now refused the request to reopen the quarry on condition that quarrying is confined to certain parts indicated on a plan, that the metal taken from the quarry be used for road purposes on the north side of the Forth only; that no metal be used and that the operations be conducted without the use of smoky or noisy engines or machinery.

"Moods of a City Square" forms the subject of a remarkably well-illustrated article in *Harper's Magazine* for this month. It relates to Madison Square, which is in the centre of the hurry of New York and bordering on its strongest current, and forms a little oasis of repose and philosophy that bears the charm and distinction of a glory that has passed, and although it is a place of memories it is still lives, while it has a future that promises to be in a different way as brilliant as its past.

A SUCCESSFUL sale of freehold land, consisting of quarter-acre to acre sites, suitable for the erection of bungalows and bijou residences, was held in a marquee on the Kent Park estate, Margate, on Monday last by Messrs. Payne, Trapps & Co., who took down from London a large and respectable company of buyers and others, who were well entertained to a substantial luncheon, and the greater portion of the fifty-five plots offered changed hand at satisfactory prices, the total amount realised being nearly 1,200*l*.

THE executive committee of the Scottish National Exhibition meeting in Edinburgh appointed Mr. Freeman, C.E., who had been assistant engineer at the Glasgow Exhibition and engineer at the Wolverhampton Exhibition, to be engineer; and Mr. A. Hay and Mr. J. D. Gibson to be surveyors for the building. It was reported that the building plans would be immediately placed in the hands of the surveyors; that it was hoped that in three weeks schedules would be in the hands of contractors, and that a beginning might be made with the construction of the exhibition buildings early in September. It was explained that the exhibition buildings in 1886 were not begun until the middle of October.

THE proposed erection of the French Exhibition and Canadian buildings will make Aldwych one of the most important architectural thoroughfares in London. The Waldorf and Aldwych theatres are already in existence, and the Waldorf Hotel is rapidly approaching completion. With regard to the latter the beauty of the fine elevation, which owes its design to Mr. A. Marshall Mackenzie, the architect, is now in striking evidence. The building has been carried out by the Waring-White Building Co. with remarkable speed and efficiency; the interior decorations, by Waring & Gillow, are well advanced, and two or three

months will see this noble hotel equipped and ready for the admission of guests. Thus the projected new buildings when erected will complete an almost unique group of fine public edifices.

THE finance committee of Paddington Borough Council, in a report issued on Saturday, refer to the increasing number of empty properties in the borough—mainly ascribed to motor-omnibus traffic nuisances—and the consequent heavy loss to local rates. The increase in the loss of rates from "empties" during the quarter ending June 30 last, as compared with the corresponding period 1906, is 14.4 per cent. The total loss on 1,577 separate premises in the last quarter is 7,004 $\frac{1}{2}$ ., against 6,120 $\frac{1}{2}$ . in the June quarter of 1906, in respect of 1,357 premises. The legal committee, reporting on the interview of representatives of metropolitan, city and borough councils with Sir E. Henry, at Scotland Yard on the 22nd ult., concerning the alleged nuisances and damage caused by motor traffic, mention that the Commissioner of Police agreed that where there was motor traffic there was depreciation of property, but he could not hold out much hope that anything he could do would remove the noise.

In the annual report on factories and workshops for 1906 the inspector for Edinburgh (Mr. Newlands) writes:—I had some experience in this district from 1896 to 1899, and on comparison with conditions, found their development is marked. Possibly that in the hosiery trade is the most conspicuous. The increase in the number of factories, size and improvement of machinery is remarkable. Electricity or suction-gas plant is here as elsewhere displacing as motive-power the more cumbersome and expensive steam, even in places where the power consumed is high. The speed of the drive in all kinds of machinery has increased. This is possibly more noticeable in printing machinery than any other class. As an example of the strides being made in this trade I would mention one machine seen recently which does away with the three different printings in the three-colour process.

A CASE was concluded at Bristol on the 25th ult. before Judge Castle and a special jury, in which a nurseryman sued the Bristol Tramway Company for damages for injury to plants alleged to result from the company's use of

creosoted blocks for road paving on the roadway along his nursery. The question raised was one not hitherto at law, and the hearing of the evidence occupied two days. The jury found that the injury to the plants was caused by the wood paving. To the question, Was it reasonable and necessary for the tramway company to repave the road in the way and at the time they did, the jury said "Yes." The question being decided on the knowledge of the tramway company at the time, "No," in the light of the evidence given. The jury also found that it was not absolutely necessary for the tramway company to use creosoted blocks. Judgment was given for the plaintiff and an appeal was granted.

THE medical officer to the Liverpool Corporation made a report to the housing committee recommending that several courts, alleys and premises in Porter Street, Denison Street and Newsham Street, being unfit for habitation, ought to be demolished. The housing committee, reporting on the proposed acquisition of Nos. 30 Saltney Street and the courts adjoining for the erection of workmen's dwellings, recommend that an application be made to the Local Government Board for a provision order under the Housing of the Working Classes Act, for acquiring these sites. The finance committee will now prove of the same on financial grounds. The Corporation surveyor reports that it is possible on this area to provide dwellings suitable for housing the dispossessed, providing for twenty-four three-roomed dwellings and twenty-two two-roomed dwellings, and he estimates the cost of acquiring the land and erecting the houses at 15,005 $\frac{1}{2}$ .. He estimates that the income to be derived from these dwellings at the present standard of rents is 447 $\frac{1}{2}$  4s. per annum, less outgoings 45 per cent. 201 $\frac{1}{2}$  4s., leaving a net income of 246 $\frac{1}{2}$  4s. per annum, or equal to a return of 17. 12s. 9d. per cent.

THE new town hall at Leigh was recently opened. The site contains 1,882 square yards, and has frontage to the Market Place, Market Street and Newton Street. The ground-floor frontage to Market Street is occupied by shops with basements. The main entrance is in the centre of the Market Place front by a projecting portico supported by columns and carved caps, carrying a moulded frieze and cornice surmounted by a circular pediment, showing the borough's coat-of-arms. The entrance hall is 45 feet

122 feet wide. The council chamber and two committees occupy the whole first-floor frontage to the Market place, and are divided by large removable doors. The two fronts to Market Street and the Market Place are in grey Dale stone. The building is designed in Late Renaissance style, and is surmounted by a large turret with a flagstaff. Mr. J. C. Kestwich, of Leigh, was the architect, and Messrs. R. Neill & Sons, of Manchester, were the builders. The total cost of the buildings, including furnishing and decorating, is about 30,000*l.*, or including the cost of the land, 40,000*l.*

A STATEMENT has been published by the London County Council relating to the debts of those towns of the United Kingdom with a population of over 250,000. The rateable value of London per head of population is 8.89*l.*, and this is only approached by Edinburgh, with 8.25*l.* per head, the next being Dublin, with 2.06*l.* per head. London's debt is given as 109,928,546*l.* Manchester has a debt of 21,000*l.*, Glasgow 17,584,000*l.*, Birmingham 16,986,000*l.*, Liverpool 14,870,000*l.* and Leeds 12,277,000*l.* The total debt per head of population is in London 23*l.* 9*s.* 3*d.*, but this high figure is exceeded by Manchester with 35*l.* 13*s.* 6*d.*, Birmingham with 31*l.* 5*s.* 8*d.*, Bradford with 28*l.* 15*s.* 10*d.* Leeds with 26*l.* 17*s.* 8*d.* Whereas less than half of the debt of London is stated to be remunerative debt, that is, that of undertakings established on the assumption that the revenues therefrom would wholly or partially meet the outgoings, the "remunerative debt" of Manchester, Birmingham and Bradford is more than two-thirds of the whole, only in the case of Leeds is the "unremunerative debt" more than that of London on the basis of population.

THE Board of Water Supply of New York City has opened bids before August 6 on the largest single contract ever undertaken by an American city, except that for construction of the first New York subway. It is for building the great masonry and earth dams of the Ashokan Reservoir in the Catskill Mountains. The principal items in the engineer's estimate of the work are as follows:—Moving steel pipes when directed; control of stream flow, Olive Bridge dam; control of stream flow, middle dam; 2,055,000 cubic yards earth excavation; 425,000 cubic yards rock excavation; 7,055,000 cubic yards refilling and embanking; 210,000 cubic yards soil for surface dress-

ing; 1,100,000 barrels Portland cement; 280,000 cubic yards concrete masonry; 530,000 cubic yards cyclopean masonry; 64,000 cubic yards concrete blocks; 125,000 square feet face dressing for concrete; 95,000 cubic yards dry rubble paving; 929,000 lbs. cast and wrought-iron, steel and bronze; caring for and setting 900,000 lbs. of metalwork furnished by the city; 200 acres clearing; 11,500 linear feet vitrified pipes not exceeding 10 inches in diameter; 10,000 linear feet vitrified pipes more than 10 inches and not exceeding 18 inches in diameter. Time allowed for the completion of the work is 84 months from the date of service of notice by the Board to begin work.

THE Board of Directors of the Manchester Chamber of Commerce have decided, at the suggestion of a joint meeting of the members of the Chemical and Engineering Sections, to place the following resolution on the agenda paper for adoption by the Association of Chambers of Commerce at the annual meeting to be held in Liverpool:—"That in view of the strenuousness of the competition between this and other leading industrial nations engaged in productive processes, it is, in the opinion of this Association, most desirable that all users of fuel, whether for power-raising purposes or for manufacturing processes, should adopt means whereby the heat-raising properties of the fuel consumed should be made use of to the highest possible percentage. This Association would respectfully urge British manufacturers to avail themselves of the most effective appliances for economising the use of fuel and for reducing the output of black smoke—taking expert advice in these matters where necessary. Incidentally—but as a most desirable consummation—this would have the effect of greatly improving the atmospheric conditions of our manufacturing centres, and would tend to reduce the friction which is apt to arise between local authorities and manufacturers where insufficient care is given to the subject of economy in fuel. The Association further believe it to be essential that the Government should press upon the various local authorities of the country that they should adopt a uniform basis of regulation with regard to the amount of black smoke allowed to issue from manufactories; and the executive of the Association is hereby requested to bring this matter before the proper Government department."

## THE "SIGNET" Combined Range and Sitting - Room Grate.

Very suitable for Small Houses, Country  
Cottages, Flats, &c. (Patented.)

Combines in itself in a **practical and efficient** manner the essential features of a Cooking Range and Sitting-room Grate.

Many of these Grates are in use at Letchworth and Cleveleys Garden Cities and elsewhere. Harmonises with artistic surroundings and looks well in any room. Size 38×38 inches.

Supplied when desired with High-Pressure Boiler, also with artistic Cast-iron Chimney-piece. Goes into an ordinary fireplace like a Register, very little building being required. Well fitted and finished.

Has been **THOROUGHLY TESTED** and has given **UNIVERSAL SATISFACTION**. This Grate can only be supplied through Builders' Merchants, Ironmongers, &c. Copies of unsolicited testimonials and further particulars may be had from the Makers,

No. 39 FALKIRK. No. 9105 CENTRAL, LONDON.

THE Continuous Transit Securities Company of New York have applied for a privilege to build a subway under Broadway from Fourteenth to Forty-second Streets, and equip it with a continuous train or moving-platform railway. The company declares that moving-platform railways would offer the most effective solution for the transportation problems such as exist on many crowded thoroughfares in New York and on the bridges to Brooklyn. The moving platform would require a right of way of only 35 feet, although its capacity would be twice as large as a four-track subway. The proposed platform would afford a seating capacity exceeding 47,000 passengers an hour in each direction. This is three times the seating capacity of a train system operating five-car local trains upon one-minute headway, and practically six times the seating capacity of a system of surface cars operating upon 150-foot headway. The applicants declare that there is practically no danger of accidents from falls on the moving platforms. The matter is under consideration.

### SAFE WOOD-WORKING PLANT.

UNDER the terms of the new Act owners are liable to heavy penalties for accidents incurred by their workpeople. This responsibility will doubtless induce the prudent employer of labour to provide every possible safeguard against risks of this nature, and has induced Messrs. Glover & Co., Leeds, to give prominence to the useful and effective contrivance illustrated in Fig. 1, showing the plant with "Ideal" guard attached, which is designed to fit saws of various diameters, while at the same time not interfering with the work in progress. This is accomplished without detracting in any way from the efficacy of the guard, which gives protection all ways; neither does it obstruct the light nor interfere with the correctness of sawing. Some guards appear only able to "box in" the saw when not being used. The "Ideal," however, claims to give the greatest possible satisfaction when working, while it allows sawing as deep as the saw will cut. From the illustration it will be seen that the sliding hood protects the front of the saw as far down as the wood being cut will allow, thus saving hands and fingers. Its angle section

makes it very rigid, and it cannot spring off by any pressure against it, nor can it be shaken off by vibration. The guard is adjusted for various diameters of saws by means of a bracket and carrying block and the horizontal shaft. The block, working on an upright shaft, also enables the guard to be swung aside, in case of sharpening in the bench when changing saws. The back of the saw is protected by a long-thin-curved-circularly adjustable hinged steel blade

FIG. 1.

held firmly at one end under the bench top by an adjustable bracket and bolt. There is a fork-hinged tailpiece in large sizes whereby the hinged blades are kept linable with the saw and rigid sideways. If preferred, for long saws a special rear guard may be arranged to lift out of place the wood, when it forms a safety "dog." A small hand wheel is used for fixing the block with the hood in

desired position. These are a few details of the apparatus which will serve to show how thoroughly and carefully the general arrangement has been carried out. Various styles of cutter blocks are supplied, as may be preferred, and if desired guards can be supported from above or at the side, leaving the top of the bench quite free.

Another excellent specialty which is calculated to absolutely prevent the possibility of such serious accidents and complications for which planing machines are responsible deserves notice. The "Hand Planer" is a most valuable machine, and would be still much more valuable except for the danger of using it even when fitted with the best guard. The usual practice has been for makers to supply the cutter blocks, upon the flat surface of which the work is done. The illustration (Fig. 2) will help to explain the design. Thus it will be seen that as the knife

FIG. 2.

has to just revolve above the table the other parts of the cutter-block spindle are by necessity left to revolve considerably underneath the table top, so that the bolts may catch the wood being planed. Then, again, the other sides of the square cutter block, not being utilised, are revolving still further away from the table top. Thus, the revolving square cutter block presents such an uneven surface, it would seem to be the most cruel and dangerous

engine for damage that could well be constructed, for it simply knows no mercy when it once commences to draw into its clutches the fingers of a man's hand; but not so with the patent "Ideal" safety circular cutter block, as illustrated in Fig. 3. It will at once be evident to our readers that in this circular arrangement it is practically impossible for any person to incur much damage, even if by accident the hand slips upon the round cutter block, for

FIG. 3.

it provides its own guard which revolves with it, and which renders it impossible for the hand or any fingers to become chopped off or seriously damaged, because the limbs are not permitted to become trapped or ensnared by any low places or gaps such as are inherent in square cutter blocks, as shown in Fig. 2, and hence it is with pleasure we call attention to this most humane and important departure. For the sake of safety alone it is worthy the consideration of everyone employing hand-planing and moulding machines, but there are several other distinct advantages which may be mentioned. First, as thin steel strips are only necessary as knives, it will at once be seen that a great saving in steel and expense is effected. Second, as perfect pressure is brought to bear right up to the

Telegraphic Address: "IRONFOUNDERS, OLDHAM,"  
National Telephone: 161 OLDHAM.

cutting edge, these are found to cut sweeter and with a much better finish. Third, these thin knives are much more quickly and easily sharpened, and are less liable to become unequally balanced. Fourth, we may point out that an extra knife is provided (and which is adjustable) immediately underneath the cutting edge of the planer knife, and which serves as the back iron in an ordinary hand plane, and most perfect planing of soft or hard wood is secured. Fifth, it will be readily understood that the patent circular cutter block is run with much less power, because there is offered no resistance to the air, but not so with the square form of cutter block, which makes a great humming noise and disturbance and unpleasant vibration. Sixth, it is astonishing to notice what heavy cuts can be taken with perfect ease, such as would be a most dangerous proceeding with the ordinary square cutter block.

### BUILDING DISPUTE AT HINDHEAD.

THIS was an action brought by Messrs. Jones Bros., builders, of Chelsea, against the Misses A. and M. Bilton, to recover the sum of 141*l.* 10*s.* balance of contract and extras for building a pair of semi-detached cottages at Hindhead. Mr. Ruegg, K.C., appeared for the plaintiffs, and Mr. J. Samuel Green, K.C., and Mr. Johnson for the defendants.

The plaintiffs claimed the sum of 100*l.* balance of contract and 41*l.* 10*s.* extras, of which sum 22*l.* was paid into Court, leaving 119*l.* 10*s.* in dispute.

The specification and contract provided that the buildings should be erected to the requirements of the Rural District Council and to the satisfaction of the defendants, and that the contract sum should be paid in instalments, the sixth instalment of 50*l.* to be paid when the houses were entirely finished, all town charges paid and the houses ready for occupation, and the balance of 50*l.* three months after completion.

The defendants pleaded that the buildings were not completed in accordance with the specification, nor to the requirements of the Rural District Council; that they were not liable for the sum of 19*l.* 10*s.* claimed as extras, and counterclaimed for the sum of 78*l.* 15*s.* for omitted works

and 86*l.* 5*s.* for work and materials of inferior description and quality, and not in accordance with the specification and 16*l.* for loss of rent, owing to the buildings not completed within contract time.

Mr. Bushell, surveyor, Mr. A. Brown, architect, Mr. F. A. Dodd, surveyor, gave evidence for the plaintiffs.

Mr. Frederic W. Hingston, architect and surveyor, Portland House, Basinghall Street, E.C., gave evidence in support of the defence and counterclaim, as to the original work and the inferior description of the materials and labour in the buildings, and Mr. Edmund J. Harcourt, architect, of 9 Gray's Inn Square, W.C., gave corroborative evidence.

After a hearing lasting over four and a half days before the Official Referee, judgment was delivered on Saturday last.

The Official Referee held that the buildings were completed in accordance with the specification and contract at the time the action was commenced, and therefore the plaintiffs could not recover the balance of their contract. As regards the sum of 19*l.* 10*s.* claimed as extras, he held there was no specific or implied contract by the defendants to pay the charges making up this amount. Judgment was therefore given for the defendants on all points, with costs of the action and counterclaim.

### SCOTTISH NATIONAL EXHIBITION.

Good progress is reported in connection with the arrangements for the Scottish National Exhibition which is to be held next year in Edinburgh. The plans have been accepted subject to any alteration required, and work on the grounds and buildings will be commenced within the next few days.

In the accepted designs the industrial hall of 100,000 square feet and the machinery hall of 20,000 square feet are included in one magnificent building, and every part both in connection with the structures and the ground has been framed with a view to charm the eye and at the same time facilitate the commercial requirements.

The classification of the various sections includes arts, education and history, arts and crafts, mining, engi-

The charge for floor space in industrial hall andinery section will be 3s. per square foot for a space of square feet or over in area. Smaller area, corner and special positions will be charged extra at the discretion of the committee.

Any further information can be obtained on application to the manager, Mr. W. H. Knight, 45 York Place, Edinburgh.

### ALSTON COTTAGE HOSPITAL.

A memorial-stone of the Ruth Lancaster James cottage hospital, which is being erected in the Townhead Field, Alston, through the munificent gift of 5,000l. from the late James, of Beaconsfield, Liverpool, has been laid. The plans were prepared about eighteen months ago by Mr. T. Scott, of Carlisle, but some little delay occurred in the selection and arranging of the site and other incidental matters, and it was not until September last year that contracts were signed for the erection of the building and the work commenced. Tenders were received for the various parts from contractors in the three northern counties, and the selected are as follows, viz.:—Mr. Joseph Birkett, Alston; Messrs. Thomas Charlton & Sons, Alston; Messrs. Northumberland; Mr. John Hewitson, slater, Newcastle and Carlisle; Mr. Joseph H. Henderson, plumber and sanitary work, Alston; Messrs. R. M. Ormerod & Son, Alston; Messrs. R. M. Hill & Sons, painters and decorators, Carlisle. The plans are arranged for the male and female sections being isolated, but both with equal facilities of access to the working parts and administrative block. A covered verandah and airing ground will form a centre feature giving access to the main vestibule and hall, and this latter direct to the administrative block. On the west side of the ward is being erected, with nurses' rooms adjoining, a provision for supervision. A sanitary wing is

erected at the north end of this ward, with proper "cut-off" vestibule and divided into compartments, each to contain all the latest and best sanitary arrangements. Towards the east end of the site a female wing is being erected, with ward and other arrangements similar to those on the male side of the buildings. Adjoining this wing will be the operating-room, with easy communication with the main entrance. The administrative block is a large wing on the north side of the site, and will contain all the rooms and appliances found in a well organised modern hospital. One end is devoted to drug and other stores and bath-room accommodation for the hospital. The matron and nurses' bedrooms, also large box and storage-rooms, will be arranged on the top floor of the building. It is being erected with white stone, a large quantity of dressed material from the Prudham quarries in Northumberland being freely used, and stone for the rock-faced walling has been brought from Nattrass Gill.

### LIVERPOOL WATER SUPPLY.

THE total volume of water delivered from the works of the Corporation during 1906, including statutory compensation waters to rivers in Lancashire and Montgomeryshire was, in gallons, 17,777,440,000; in cubic feet, 2,848,948,000; and in tons, 76,364,000. The consumption of water within and around the city amounted to 9,643,087,000 gallons, as compared with 9,854,442,000 gallons in 1905; and the quantity supplied outside of the Liverpool compulsory district was 186,580,000 gallons against 189,130,000 gallons to Chorley, and 971,379,000 gallons against 781,822,000 gallons to other localities. The total figures were thus 10,801,046,000 gallons against 10,825,394,000 gallons, the sources of supply being Vyrnwy, 5,759,995,000 gallons; Rivington, 3,785,644,000 gallons; and wells, 1,216,461,000 gallons, together with 38,946,000 gallons of salt water. The total number of fires in the city and suburbs, for the extinguishment of which water was used from street hydrants, was 145. The additional number of new houses and other new premises supplied with water in the Liverpool district during the year was 3,463. The number of houses pulled down, or from which water was withdrawn,

Showrooms, Saracen's Head Buildings, Snow Hill, City,

W. B. CLARKE, Agent, where the "Drawwell" can be seen in action.

was 975, leaving a net number of 2,488 additional water tenants. The total number of tenants on the rent roll of the water account at the end of the year was 195,535. The total length of additional distributing and fire mains laid was 73 miles, and the number of new hydrants fixed was 341, as well as four others which were substituted for fire plugs. The total number of fire hydrants in the compulsory area is now 11,646. There are also still remaining 824 of the old-fashioned fire plugs, which are being gradually replaced.

#### ADVERTISEMENTS ON HOARDINGS.

THE Building Act committee of the London County Council report that they have had under consideration the proposals contained in the Advertisements Regulation Bill which has been introduced into Parliament in the present session. The object of the Bill is to authorise local authorities to make by-laws for the regulation and control of hoardings used for advertising purposes, and also for the regulation of advertisements. The committee are of opinion that it should be made clear in the Bill that the Council's powers under section 22 (as to lines of building frontage) and other sections of the London Building Act, 1894, or under any other Acts are not to be affected by any by-laws made in accordance with clause 2 of the Bill. So far as London is concerned the powers intended to be conferred by the Bill may clash with the powers as to hoardings, particularly those powers given by section 84 of the London Building Act, 1894, now administered by the metropolitan borough councils; and further there is no express provision as to who is to enforce the by-laws when made by the Council. It is to be inferred that the administration of the by-laws is to be vested in the local authority under the Bill, *i.e.* the Council. If this be the case inconvenience may arise owing to the dual control of hoardings thus set up, and the committee suggest that this might be obviated were the administration of the by-laws, when made by the Council, vested in the metropolitan borough councils. They have sent an intimation to this effect to the Parliamentary committee, and have also drawn that committee's attention to the existing laws relating to hoardings. They recommend that the Parliamentary committee do endeavour to obtain the insertion

in the Advertisements Regulation Bill, 1907, of provision to the effect (i.) That the Council's powers under section 22 and other sections of the London Building Act, 1894, under any other Acts, shall not be affected by any by-laws made in accordance with clause 2 of the Bill; and (ii.) that the administration of the by-laws, when made by the Council, shall be vested in the metropolitan borough councils.

#### SCALE IN BOILERS.

DURING some years experiments have been undertaken at the engineering experiment station of the University of Illinois to determine the effect of scale on the transmission of heat through locomotive boiler tubes. It has been reported in a report of the American Railway Master Mechanics' Association that the effect was an average increase in the consumption of coal. The result of the Illinois experiments is stated as follows:—

From the point of view of the physicist the experiments are open to objection as to method. From the engineering viewpoint it is believed that the possible errors of the experiments do not by any means account for an irregularity in the plotted results, and, considering the controversy upon this subject and the comparatively meagre information available, it is deemed proper to publish at this time the results as they stand, in the hope that they will elicit additional information which may be of interest in some quarters. Conclusions:—

In so far as generalisation is warranted we may summarise the results of the tests in the following conclusions:—

1. Considering scale of ordinary thickness, say of thicknesses varying up to  $\frac{1}{8}$  inch, the loss in heat transmission due to scale may vary in individual cases from insignificant amounts to as much as 10 or 12 per cent.
2. The loss increases somewhat with the thickness of the scale.
3. The mechanical structure of the scale is of as much or more importance than the thickness in producing loss.
4. Chemical composition, except in so far as it affects the structure of the scale, has no direct influence on the heat-transmitting qualities.

YORK.—Aug. 10.—For erection of two dwelling-houses on the Southlands estate, facing Bishopsthorpe Road. Mr. George H. Pegg, architect and surveyor, 23 Spurriergate, York.

IN consequence of a decision of the East Riding County Council it is believed that the construction of a bridge over the Ouse will shortly be commenced. Subject to the arrangement of toll charges and one or two other details, the Council have agreed to bear one-third of the cost of erecting a transporter bridge at Boothferry, about a mile from Goole. The total cost will be about 26,000l., and the West Riding County Council and the Goole Urban Council have already agreed to bear one-third each.

TRADE NOTES.

South Wales and Monmouthshire Training College, Llanarthney, has been ventilated on the "Boyle" natural system, under the direction of Mr. Ernest Collier, architect, Llanarthney.

The isolation hospital for the new Leicestershire and Rutland asylum is being warmed and ventilated by means of Shorland's patent Manchester grates.

The British Flooring Company (W. A. Osborne) have secured the contracts for 600 yards mosaic paving at the Wesleyan College, Handsworth, Birmingham; large parquet floors, Wimpole, Street, W.; and wood-block floors for several houses at Hendon.

The following awards have been made at the Congress School Hygiene:—

Silver Medal.

British Sanitary Company, earth closet.

Bronze Medals.

Bratt, Colbran & Co., heated fireplace in glazed earthenware; British Challenge Glazing Company, lead-covered steel glazing bar; Candy & Co., glazed faience "Devon" fireplace; England Works, Leeds, steel-contained cloakroom fittings; Fletcher, Russell & Co., Ltd., laboratory and workshop appliances for use with gas; Leeds Fireclay Company, "Infanta" closet for girls and "Taper" type coal; Newton, Chambers & Co., "Izal" co-efficient 13.0.

NEW CATALOGUES.

The series of dog grates in the catalogue issued by the "Bell" Range and Foundry Co., Ltd., 70 Mortimer Street, London, W., has been well inspired. They are suggestive of old-fashioned hearths, but they possess the scientific advantages which have been derived from modern experience. The style will be indicated by the titles—Queen Anne, Old English, Georgian, Gothic, Adams, Louis XIV., Tudor. Each has sufficient characteristics of the special period to warrant the classification, but there is no slavish or obtrusive ornamentation. The designers have remembered that a grate has a purpose of its own, and they have been careful to preserve it. It would be difficult to decide which is most deserving of preference. But whichever is selected for a house in any of the styles named, it will be found to harmonise with the architecture. The "Bell" Range and Foundry Co. allow a three months' trial of every grate, and if at the end of that time there is any disappointment the grate can be returned at their expense, and they will not only remit the full amount charged, but will also pay the builder's account for fixing and removing. Self-confidence could not be more clearly expressed.

The Hull City Council have decided to purchase a site in the Cottingham Road for the erection of a training college.

The Aberdeen Town Council with a view to prevent explosions have authorised the engineer to replace the existing copper strip culverts by cables on the solid system, and that the Union Street system should be commenced as soon as arrangements can be made. The estimated cost of the work is about 9,000*l*.

The Manchester city treasurer, in the course of a voluminous report, appends a detailed statement showing the net payments from the year 1821 to March 31, 1907, on account of public street improvements in the city. The amount reaches a total of 3,283,892*l*. 0*s*. 5*d*. In the balance sheet only the vacant and surplus land available for sale is included. The value of all land laid to the streets is left out.

MARPEDO WHITE JAPAN

SLOW DRYING.

Marpedo is suitable for either exterior or interior High-Class Decorative Work, invaluable to Architects, Decorators, Ship and Yacht Builders, Railway Companies, etc. It is easy to manipulate, and large areas can be covered evenly. When dry it presents a hard, brilliant and durable surface, which will not crack. Properly prepared surface one gallon of MARPEDO SLOW-DRYING WHITE JAPAN will cover about 80 square yards. It dries in about 12 hours.

## VARIETIES.

THE Bath Town Council have adopted a report recommending an application to the Local Government Board for sanction to a loan of 10,000*l.* for housing (in eighteen new dwellings).

MR. JAMES SCOTT WEIR, assistant borough engineer to the Halifax Corporation for the last seven years, has been appointed borough surveyor and engineer at Jarrow-on-Tyne, at a salary of 200*l.* a year.

THE Grangemouth Town Council has unanimously agreed to borrow 20,000*l.* on the security of the water assessment to defray the expense of constructing the reservoir on the Bannockburn and other works.

THE plans committee of the Aberdeen Town Council have remitted for further consideration the plans of the new slaughter-house proposed to be built by the Fleshers' Incorporation at a cost of 13,000*l.*

THE Court of Common Council have made an agreement with the Great Northern and City Railway Company and the Corporation, providing for the deposit by the Company of the sum of 30,000*l.*, pending the construction and completion of the works at Lothbury station. The document was duly sealed.

THE Cheshire County Council have approved a scheme for improving and enlarging Upton lunatic asylum, to provide additional accommodation for 438 patients at a cost of 125,500*l.*, and for enlarging the Park lunatic asylum, Macclesfield, to provide for 148 additional patients at a cost of 25,000*l.*

THE new lighthouse which has been completed at Blyth is constructed of reinforced concrete, having steel rods carried from the foundations of the pier to the summit of the tower. The base measures 35 feet in diameter. The height to the focal plane is 63 feet above high-water level. Oil for lighting purposes will be stored in the basement.

THE Surrey County Council have given formal consent to the Sanderstead Parish Council raising a loan of 4,000*l.* for the purchase of Purley Beeches. The area of the property is 13½ acres, and in the proposed deed of purchase provision has been made for the property being maintained in its present natural state.

THE tramways committee of the Rochester Town Council recently reported their decision to accept the tender Messrs. Dick, Kerr & Co. for the construction of tramways 33,568*l.* 17*s.* 6*d.* for the permanent way and 3,417*l.* 18*s.* the overhead equipment. The report was approved and Mayor observed that a start would be made with the work about a month.

THE Thames Conservancy Board have agreed to make borings in the river above Gravesend, at a cost not exceeding 500*l.*, so as to obtain data regarding the feasibility of deepening the channel. It has been stated by an engineer that a channel 30 feet deep and 600 feet wide be made from Gravesend to the Royal Albert Docks.

THE Stoke-on-Trent Town Council recently sent a committee to the Stafford destructor works, for the purpose of inspecting the process there of making paving flags from the furnace clinker, when it was recommended that a similar system be installed at these works, and that committee which visited Stafford be granted executive power to utilise the present sheds at Field Place, and to have necessary alterations to such sheds carried out and purchased materials for the flag-making process.

MR. H. R. HOOPER, an inspector of the Local Government Board, commenced an inquiry at the offices of Stretford Urban District Council into the application of the Council for sanction to borrow 53,460*l.* for purposes of their electricity undertaking and 3,985*l.* for works of street improvement in Cornbrook Street, Darnley Street and Derbyshire Lane. The inquiry as to electricity was adjourned, the inspector stating that it would probably resume in the first week of October.

In the House of Commons on Tuesday, Mr. Ellis Davison asked the Secretary of State for the Home Department whether he would undertake that some Welsh-speaking representative of the quarrymen should be a member of the Mines Commission when such Commission deals with the question of the working of open slate quarries in North Wales. Mr. H. Samuel, in reply, said:—"The Royal Commission will not reach that part of their inquiry which deals with quarries for some time yet. When they do so I will consider my hon. friend's suggestion."

ILLUSTRATIONS.

WESTMINSTER CATHEDRAL—BALDACHINO.

HOUSE AT MAIDENHEAD—SOUTH FRONT.

IRLAND LIBRARY COMPETITION.—FIRST PREMIATED DESIGN—  
SECOND PREMIATED DESIGN.

VILLA RESIDENCE AT ELSTREE.

Mr. HENRY KNIGHT had before him, at the Mansion House police court, a labourer charged with breaking a glass window, 21 feet by 10 feet, valued at 100*l.*, in a shop in 21 Gracechurch Street. A notice was recently hung in the window stating that this was the strongest sheet of plate-glass in the world. It measured 114 inches in length, was 114 inches high and contained a surface area of 202 feet. It was over  $\frac{1}{4}$ -inch thick, weighed nearly one ton, took three months to manufacture and required the united efforts of forty men to fix it.

The Liverpool City Council have adopted the recommendation of the lighting committee to experiment on lamps at the pierhead with a patent automatic lamp-lighting and extinguishing apparatus, which acts simultaneously through a clockwork attachment to each lamp. It is stated that the system works successfully at Folkestone. To completely instal the automatic system over the pier would cost a capital outlay of 37,458*l.*, but it was estimated it would save 13,000*l.* every year on the cost of lamp-lighting labour.

At the last meeting of the Wednesbury Town Council Mr. J. Williams, in presenting a report from the works and building committee, said plans had been made for the erection of a number of additional houses. The report showed there was great activity in the building of new houses. A most satisfactory feature was that the houses were tenanted immediately they were finished, and in some cases before they were finished. The conclusion to be drawn was that either the population and the rateable value of the town were rapidly increasing, or else people were removing from the old insanitary buildings into new houses which possessed the improvements of modern

science. In any case it was a very healthy and satisfactory position.

Mr. M. K. NORTH, M.Inst.C.E., held at Coventry a Local Government Board inquiry on the 2nd inst. into the Coventry Corporation's application to borrow 13,630*l.* for the purpose of the erection of workmen's dwellings. It is proposed to build forty-eight houses in Narrow Lane at a cost of 200*l.* each, and twenty-two tenements in Short Street at 150*l.* each. It is proposed to let the former block at 5*s.* per week each house, and the second lot at 4*s.* or 4*s.* 2*d.* The Inspector stated that the Board took exception to some details of the scheme—*inter alia*, to the staircase leading out of the living-room in the Narrow Lane houses. The city engineer replied that economy had to be studied in order to bring the total monetary outlay within an amount that would allow the houses to be let at cheap rates.

The gas and water committee of the Maryport District Council recommend the Council to apply to Parliament for powers to lay an additional pipe to the mill-race from the Derwent at the Goat, Cockermouth, and thus double the present supply at an estimated cost of 20,000*l.* At present the waterworks yield an annual profit of about 800*l.* As an alternative scheme, it was suggested that the town obtain a gravitation supply from the Dash, a stream flowing from the eastern side of Skiddaw, and so save 800*l.* on pumping from the Derwent. But as this would mean ten additional miles of pipes and the impounding of the stream at an additional cost of probably not less than 35,000*l.*, it was decided to adopt the cheaper scheme.

The Birmingham City Council have held over the consideration of the following motion till their next meeting in October:—"That, in order to avoid the evils arising from sweating, which is mainly due to sub-contracting, it be an instruction to the several committees of this Council that in all contracts for manufactured articles (not being patented articles), including stores or constructional work, where the contractors sub-let the whole or any portion of their contract they shall supply to the committee the name of such sub-contractor and the address where such work is being constructed or executed. This information shall also be given by the said committees to any member of this Council on application. In placing contracts all conditions as to rates of wages, &c., shall apply to sub-contractors."

THE TRUSSED CONCRETE STEEL CO., LTD., 53 CAXTON HOUSE, WESTMINSTER, S.W.

ACCORDING to the annual report of the Warwickshire county surveyor 37,440*l.* 17*s.* 10*d.* has been expended during the past year in the maintenance of the roads directly under the control of the Warwickshire County Council, the cost in the three previous years being—1904, 27,556*l.*; 1905, 29,033*l.*; and 1906, 32,158*l.* Mr. Willmott points out that the amount spent on the main roads during last year was the highest since the direct maintenance of the roads was taken over in 1891. The mileage of roads under notice is 457, and in their repair 40,096 tons of hard stone were used. No tarmac has been used during the year. The length on the Coventry Road which was put down about fifteen months ago has so far stood the motor and other traffic very well. There was no doubt about this material being dustless, but as far as its wearing qualities are concerned Mr. Willmott considered it was still on its trial. The average cost of road maintenance worked out at 570*l.* a mile.

THE British Commercial Agent in the United States (Mr. E. Seymour Bell) reports that a large cement company has been formed to combine several of the most extensive plants outside the control of the so-called Cement Trust—the American Cement Company. The new company, which will be known as the National Cement Company, will construct in Carpentersville, New Jersey, what is expected to be the largest Portland cement plant in the world, capable of producing 10,000 barrels of cement a day. Construction work will begin immediately, and the works are expected to be in operation by May next. A feature of the new works will be the extensive use of electricity, which power will be employed to a greater degree than has hitherto been attempted in cement making.

At the meeting of the Stafford Rural District Council on Saturday last the sanitary and plans committee reported that a letter had been received on behalf of Messrs. Chance & Hunt, chemical manufacturers, Wednesbury. The letter stated that the firm were anxious not to commit any breach of the Council's by-laws, and explaining that as the buildings they proposed to erect at Stafford were intended for the purpose of working a brine mine underneath their land, and of making salt, they did not, under these circumstances, think it was necessary to submit plans of the buildings to the Council. The clerk had been instructed to reply that, as the proposed new works would be for the manufacture of salt,

they would be regarded as a building under the war class, and requesting that plans should be submitted to the Council before any further action was taken. The decision of the committee was approved by the Council.

"THE Scottish National Exhibition of Industry, Science and Art, Edinburgh, 1908," is the title by which the Association formed to promote and carry on the exhibition at Edinburgh next year has been registered. Registration has been taken out under the Joint Stock Companies Act, a nominal capital being stated, and the word "limited" omitted from the title of the Association by license of the Board of Trade. Every member of the Association takes to contribute to the assets of the Association at the event of the same being wound up during the time he is a member or within one year afterwards, for payment of debts and liabilities of the Association contracted before the time at which he ceases to be a member, and of the charges and expenses of winding up the Association for the adjustment of the rights of the contributors and themselves, such amount as may be required not exceeding 1*l.*

THE exhibition at the Crystal Palace appertaining to health, the home, &c., and which was to be of such a comprehensive character, appealing among others to architecture, has turned out an utter failure. The exhibits are few in number, and for the most part of an uninteresting character. An exception, however, must be made in favour of the Cloisonné Glass Company, who have an artistically arranged stand, on which are displayed very good specimens of work, showing that their material is applicable in any situation in which stained or leaded glass is appropriate, including also hall doors, fanlight ceiling lights, partitions, screens, window blinds, furniture, cabinets, fire screens, tables, trays and lamps. Emdeca Company likewise have a very fair display, adjoining stand, of their decorative material, which is worthy of attention. Near the main transept, it may be added, is a large case showing the work of the different classes at the Crystal Palace School of Art, comprising original designs of sketches, oil studies and water-colour drawings, also portraits and a well-executed model in plaster, all of which are of a character that reflects credit on the students as well as the teachers.

## A WOOD PRESERVATIVE.

United States Vice-Consul at Ghent, Mr. J. A. van as informed the Washington Bureau of Manu- s that recent experiments made in Belgium with a al-tar extract, known as "Injectol," for preserving have given satisfactory results. The experiments incipally devoted to the treatment of wooden poles cks used in street paving. The product is a liquid rk-brown colour, very thin and of regular density, degree of viscosity changes very little with atmo- variations. One of the principal advantages is its tion into certain woods without any pressure. It n found that where creosoted poles in the ground ly resisted decay for a few months, those treated ectol remained unattacked after three years. Similar ents were also made with railway sleepers, treated erent antiseptics. Some were soaked in a mixture reosote, creosote and chloride of zinc, and two were with Injectol. After having been left for a period ears in a steeping vat composed of liquid manure er miscellaneous decomposing substances, it was at the two treated with Injectol were still in good n, while the others were almost completely destroyed. results were obtained with wooden blocks for street Other experiments are now being carried on, and ults obtained will soon be made public.

Boulton-on-Dearne an inquest was held on a foreman er, employed by the Midland Railway Company, s knocked down by a Great Central express train. dence was that deceased with other workmen was g the wall of a bridge between Swinton and He was working about 8 feet from the rails. r bricklayer, on being given a signal of the approach in, told him to keep clear. However, on turning fter the express had passed, he saw him lying about s away from where he had been working, with his ose to the outer rail. The coroner said the only tion was that deceased stepped back to admire his en the express was passing. "Accidentally killed" verdict returned.

## COPPER MIRRORS.

THE importance from the point of view of the health of the workpeople of obtaining a substitute for the tin amalgam used in the manufacture of mirrors has led many chemists, says Mr. F. D. Chattaway in a paper read before the British Association, to study the conditions under which metals are deposited from aqueous solution. These investigations have, however, usually had for their object the preparation of a liquid which would deposit a uniform and coherent layer of silver over a large glass surface at the ordinary temperature. Liebig was the first to solve this problem satisfactorily, and his method in which milk sugar is the reducing agent was formerly extensively used. Other metals are not so easily deposited, and copper, which, from its close relationship with silver one would expect to behave similarly, has never been observed to be so laid upon glass. Although copper mirrors have never been obtained by deposition of the metal from an aqueous solution, Faraday about the time when silver mirrors were attracting much attention made the interesting observation that a mirror-like deposit could be obtained by dissolving a little oxide of copper in olive oil and heating plates of glass in a bath of this liquid up to the temperature at which the oil decomposes. The mirrors, however, obtained by Faraday's method, if of any size, are liable to be stained or discoloured in patches by decomposition products of the oil, and they are, moreover, generally lacking in brilliancy. Further, as the deposition of the metal only takes place when the oil decomposes, the process is excessively disagreeable to carry out, and since the oil is spoiled it is also somewhat costly. In the course of an investigation on the oxidation of aromatic hydrazines, the author made the observation that when solutions of cupric oxide are reduced by these compounds the metal is deposited upon the glass in the form of a brilliant coherent film if clear vessels are used. The mirrors obtained by this method are very beautiful, as they show the lustrous red colour of burnished copper, and are as perfect in reflecting surface and as uniform as the similar mirrors obtained by the deposition of silver. It seems probable that this method of depositing copper upon glass could receive important application in the production of objects of art.

### A CONCRETE BUNKER.

THE accompanying illustration is from a photograph of a reinforced concrete coal bunker being constructed in the southern part of England on the Kahn system. The photograph shows clearly the method of using Kahn bars in reinforced concrete and the ease with which these bars can

be used. As can be seen, the shear members are all properly placed. The rigid connection between the shear member and the main tension makes it impossible to displace any of the shear members during the operation of depositing the concrete.

### BUILDING SCHOOL FOR SOUTH LONDON.

THE education committee of the London County Council propose to acquire a site in south-east London for an institute for classes in the engineering and building trades. The new institution will be organised mainly as a school of building and engineering, with auxiliary classes in physics,

chemistry, mathematics and any other subjects which may be found necessary for the complete training of the classes connected with the engineering and building trades. The classes will be differentiated from the University classes which are held at the Goldsmiths' College, New Cross, and it is proposed to erect the new institute near Old Cross stations at New Cross or Lewisham junction. The education committee have recommended the expenditure on capital of 7,000*l.* in respect of the purchase of a site for the institute. They have also recommended the expenditure of 10,000*l.* on the purchase of a site for new premises for the Wandsworth Technical Institute. The finance committee, reporting on these proposals, state that when these matters were referred back to the education committee for further consideration in March last, they understood it was essential that the total capital expenditure involved in the provision of the two institutes, including the purchase of sites, would amount to 50,000*l.* and 42,000*l.* respectively. The finance committee have since been in communication with the education committee as to the general policy they propose should be adopted in connection with the provision of facilities for technical education in London. The information furnished by that committee, it is stated, that the education committee contemplate expenditure during the next five years or so of over 400,000*l.* on account on the extension of the Council's institutes, and 80,000*l.* on maintenance account in the form of grants to polytechnics for works of extension, and additional expenditure on rate account after five years of 21,000*l.* a year, exclusive of any additional annual maintenance grants which may be made to the aided institutions which have to be incurred by the Council in the provision of institutions upon which the capital expenditure is contemplated. The finance committee point out, however, that the matter is one of considerable financial importance. It is represented to them that the proposals now submitted are urgent, and they have accordingly submitted recommendations, although they would have preferred before doing so to have had an opportunity of giving closer attention to the general considerations involved in the whole question of prospective expenditure upon technical and scientific education, which will, the committee anticipate, have an important bearing upon the Council's finances in the future.

**GRANITE QUARRYING IN ABERDEENSHIRE.**

APER on "Granite Quarrying in Aberdeenshire" was by Mr. William Simpson, assistant harbour engineer, Aberdeen. According to the *Aberdeen Journal*, he said the granite areas of North-East Scotland were distributed in an irregular manner over that part of the country, and attained their greatest development in the county of Aberdeen. Continuous masses stretched along both sides of the Dee, terminating westwards in the Cairngorm Mountains beyond Invermoriston, while in Central Aberdeenshire large irregular masses were to be found in the district occupied by the upper reaches of the Don, in which were situated the well-known Invermay Quarries, and those of Tom's Forest, Tillyfourie and Bennachie. The Aberdeen quarries were situated near the mouth of the Dee and Don in the vicinity of the city, and included, amongst others, Rubislaw, Scattie, Dancing Men and Oldtown quarries, the granites of which were of the typical colour of the granites of the Dee and Don. The Peterhead granite area was entirely isolated from those of the Dee and Don, and the stone was quarried in the immediate vicinity of that town, the typical colour being red. Nowhere in the whole of Great Britain was there such a large exposure of granite as in North-East Scotland, and the supply of granite stone of the highest quality and beauty was practically inexhaustible.

*Characteristics of Quarries.*

The Aberdeen quarries were of a characteristic oval shape in plan, and of a deep pit-like section, of which Rubislaw and Kemnay quarries might be taken as typical. These quarries were the largest granite quarries in the United Kingdom, and had each a depth of over 300 feet, which was gradually being increased. The commercial granite was found in "posts" or isolated masses cut off from each other by "bars" of inferior and even worthless granite, and the joints were highly irregular, features which rendered the quarrying of Aberdeenshire granites a difficult task, and the principles of quarrying strictly indefinable. Usually the granite was a more or less thick covering of exceedingly hard boulder clay, and for some distance down the surface rock was usually of inferior quality, owing to the decay of the felspar. The overburden was

thus costly to remove, and the top rock unremunerative. Under these circumstances the main principle underlying the development of the Aberdeenshire quarries was to work downwards, after a sufficient area had been opened out in which to locate the relative positions of good rock, "bars" and "master" joints, and to afford ample room for carrying on quarrying operations. As a rule, the quality of rock also improved with the depth, and there was thus a temptation to deepen without a proportionate surface area. Where this had been done the quarry had assumed the form of a conical pit with a small floor, difficult and costly to work and in some cases finally abandoned for these reasons.

*Sinking and Excavation.*

After a sufficient top area had been opened out in which to conduct operations, the quarry was deepened by sinking in successive benches or "dips" of about 40 feet to 60 feet at a time, and, if possible, the actual depth of the "dip" was determined by a natural horizontal bed-joint, so as to facilitate the excavation of the rock; but should this not be met with, a "dip" was rarely carried down more than 70 feet. In working out a "dip," a shaft was first opened at an extreme point of the quarry floor close up to the side or wall of the quarry, and from this shaft operations were extended outwards, until the whole area of the floor had been excavated to the level of the new "dip." The shaft was sunk as quickly as possible the full depth to the main bed-joint, and was opened out laterally to meet the "master" joints traversing the quarry in the direction of working, and thus obtain the best possible working face bounded by rock-joints. The presence of such joints largely determined the direction in which the rock was to be excavated. The rock was removed by boring and blasting, and for this purpose the working face was usually divided into two benches. The top bench was first worked back to meet a good vertical joint, a distance generally of from 20 feet to 30 feet from the face, after which the bottom bench was excavated and the rock entirely removed down to the level of the floor of the "dip." Vertical shot-holes up to 21 feet deep were used to blast out the upper part of the benches, and "breast" holes to remove the basal parts of the working face where there were no bed-joints. These latter were placed at an inclination of about 10 degs. to

15 degs. to the horizontal, and were drilled up to 21 feet long, as the nature of the rock might require, and were calculated to increase the efficiency of the blast and level up the quarry floor. As it was not convenient to use the ordinary rock-drill tripod for such holes, a special frame made of timber was employed for this purpose on which the rock-drill was mounted, the frame being loaded with stones to steady it. As the rock was blasted out the blocks were lifted from the working face by cranes and cableways, but the larger masses, beyond the power of the lifting appliances, were further broken up as they lay.

#### *Rock Drilling.*

The drilling of shot-holes was done by power-drills worked either by steam or compressed air. Hand-drilling was only resorted to where it was impossible or inconvenient to use a machine-drill, as in bringing down dangerous parts of the quarry wall. The machine-drills were chiefly of the Ingersoll or Henderson (Aberdeen) types, and the usual motive-power was steam. At Kemnay Quarries air-drills had been in use, along with steam, for several years, and the installation was being further extended; while at Rubislaw Quarry a complete new air-compressing plant, of the Ingersoll-Rand type, driven by a 100 horse-power shunt-wound electric motor, had quite recently been laid down for exclusively working the rock-drills, the pressure being 100 lbs. per square inch. In the smaller quarries steam was exclusively used for the rock-drills, and was found to be economical. When steam was used the power was obtained from a central boiler-house situated on the quarry bank, the main steam-pipe being carried down the quarry wall to the floor, where a branch of wrought-iron piping was taken off to supply the drills, terminating at each drill in a length of flexible metal hose-pipe. As the working face receded from the main pipe new lengths were coupled on to the branch pipe to follow up the drills. A considerable loss of power thus took place when the line of steam-pipe was long, and in the larger quarries the air-worked drills were considered to be more economical if the work was not intermittent.

#### *Blasting the Granite.*

In granite quarrying the main object was to obtain large blocks, and explosives must therefore be applied judiciously

and in a sparing manner. Coarse gunpowder was used in the Aberdeenshire quarries for blasting purposes, as high grade explosives, such as dynamite and gelignite, shatter the rock too much, and were not used at all except to break away bad rock or in very wet places. No general formula could be given to determine precisely the amount of charge for a blast, owing to the very irregular nature of the rock, but it was estimated that one pound of gunpowder should produce eight tons of rock under ordinary conditions of quarrying. In blasting out a long face vertical holes were drilled right down to the horizontal bed-joint, and a distance back from the working face generally equal to the depth and small charges of gunpowder used, the object being to "heave" the mass on its bed without shattering it. If one end of a working face was "bound," as sometimes the case, a narrow trench was blasted free out between the quarry wall and the working face to prevent this method of blasting being carried out. The mass had thus been "shaken" and the joints developed, it could be blasted off into smaller blocks and dragged from the face. For "breast" blasting, where there were no natural joints, the shot-holes were usually placed in line of the face together with about 1½ inch of clearance between each hole to the top, but both the position and number were decided by the actual rock-joints and the quantity of material to be dislodged. Groups of three, five and seven holes were common, and these might be drilled parallel, radially or in different planes. If dry, vertical shot-holes were filled directly from the top with loose powder passed through a copper filter, but in the case of wet holes, the powder was made up into a cake, and the shot-hole blasted by filling it into thin waterproof tubing and tying the ends securely. Dry "breast" holes were loaded from the top with a piece of open-end copper tube 1½ inch in diameter, fixed to the end of a long timber rod. The regular shot-holes were fired electrically, and the detonator or electric fuse was placed about 9 inches from the surface of the charge in the bottom of the hole, and was tied up with the cartridge in wet holes. In some quarries a time fuse was also inserted into the charge of each shot-hole as a safeguard against electrical mishap. The charge was rammed home with a timber ramrod, and the holes were stemmed or tamped with granite dust. The electric wires of the shot-holes were connected up

"this method being preferred to that of "in parallel," the charges were fired by a high-tension electric der. The firing was done either during meal-hours when work had been stopped for the day, unless the e of the blast was such that the men could readily safe cover in the quarry. A steam-jet was used at of the quarries for effectively washing out the tamping charge of a misfire shot-hole, instead of boring a new ongside.

#### Hoisting of Quarried Materials.

the great depth and steepness of the Aberdeenshire es necessitated the hoisting of all quarried materials surface direct by means of cranes and cableways. In smaller quarries the cranes were confined entirely to ank, and did all the hoisting necessary with the assist- of cableways; but in the larger quarries additional were placed on the quarry floor to hoist the stone the working face of the "dip," and bring it within of the bank-cranes, and if necessary the cableways. e there were a number of floor-cranes they were l within continuous reach of each other to facilitate ansport of materials to the most suitable bank-crane e stone-dressing spaces on the quarry floor. Floor- s were lowered with each successive "dip" if the was worked completely out, but bank-cranes were y permanent as regards position. Cableways were ged in such positions as would intersect the working nd give delivery of materials at convenient points on ank, but might be shifted from time to time to suit the pment of a working face or changes in surface gements.

#### The Cranes.

eam derrick-cranes were used for winding from the y bank with the exception of Rubislaw Quarry, where icity was the motive-power. The cranes were placed to the edge of the quarry on a pier of granite masonry, to give full effect to the jib and afford the operator a view, and the back legs were loaded by building them granite piers. The usual lift of such cranes was s, 10 tons and 15 tons, and steel wire ropes were used sively. The essential features of the more modern of crane used for bank winding were long jibs, large

drums for deep winding in excess of present requirements, powerful engines and gear for quick winding, slueing and luffing, powerful burden and wind brakes, and the whole of the gear within easy reach of the operator. In the more recent cranes the mast and jib were of steel. The general design of such cranes required to be heavier than that of a similar crane doing ordinary work, for, in addition to simple lifting, they were constantly used to drag rough stones over the quarry floor and to "break out" locked stones from a working face after a blast. Accidents to jibs were not infrequent, and many quarry masters preferred timber instead of steel for this purpose, as a timber jib could readily be renewed at the quarry work-shop. On the quarry floor ordinary steam or electrical derrick cranes were used, but in a number of quarries a modification of the derrick was to be found in the "all-round" crane. This type of crane had no back legs, and was supported from the top of an extra long trussed mast by a series of radial wire ropes, generally eight in number, which were anchored to the sides of the quarry, quite clear of the jib. This arrangement was economical of floor space, and allowed the jib to revolve completely round. Cranes of this type were to be found in Kemnay, Rubislaw, and other quarries. The floor cranes varied in power from 5 tons up to 10 tons and 15 tons, and either steam themselves, or were supplied from a central boiler-house on the quarry bank. An objection of self-steaming cranes on the floor arises from the black smoke in thick weather obscuring the view of cableway and crane operators on the bank, and was particularly felt in deep quarries of small area. The floor cranes in Rubislaw Quarry were originally steamed from the quarry bank, but had been recently converted into electrical machines by replacing the engines of each crane with a series-wound motor of 25 horse-power at 440 volts, and with controller and cast-iron resistances. Where very large stones for monumental and engineering purposes were quarried, a bank crane of special capacity had been laid down.

#### The "Blondins."

The successful commercial working of the Aberdeenshire quarries would be impossible at present without aerial cableways, or "blondins," as they were familiarly

York Mansion, York Street, Westminster, S.W.

termed, and their introduction was due to the late Mr. John Fyfe, proprietor of Kemnay Quarries, who designed and erected, at No. 1 Quarry, Kemnay, the first modern cableway in this country. Two types of cableway were used, namely, "horizontal" and "inclined," the former of which had two masts, between which the main cable was stretched. In the more recent quarry cableways of long span an additional rope, called a "button" rope, about  $\frac{5}{8}$ -inch diameter, was hung above the main cable for the purpose of supporting and guiding the hoisting rope, and was provided with buttons or stops at intervals. Light iron hangers were carried on the horn of the load carriage, each having a loop corresponding to a special stop on the button rope, and as the carriage receded from the mast the hangers were caught and spaced out over the span, to be again picked up by the horn on the return journey. The load carriage was a light steel frame of flat bars with three wheels travelling on the span rope, and an extra wheel on the button rope. From it were hung directly the hoisting sheaves, and the endless travelling rope was attached to each end. To suit the carriage to the varying inclinations of the span rope, and equalise the load, two of the main wheels were placed on an equilibrating lever within the main frame. The masts were of timber, and carried the sheaves at top and bottom for leading the hoisting and travelling ropes to the engine-house. Under special conditions of height and load, masts were strengthened at the base by braced timber trestlework, or built entirely as braced timber towers, as at No. 1 Quarry, Kemnay, where the span was 945 feet and the load 8 tons. To avoid departing from the simple form of mast in such cases at many of the quarries a pier of dry-built granite masonry was raised to the required height, and on this the mast was placed without further modification. The masts were usually anchored by wire-rope backstays, connected to concrete or masonry blocks with adjusting screws between, but in some cases the main cable was passed over a pulley, and a back balance weight suspended from the end, somewhat in excess of the working load of the cableway, so that, should an overload be attempted, the back balance will be hoisted instead. Five tons lifting capacity was found to be a serviceable working load for a quarry cableway, but the older machines lifted about 3 tons, and at Scattie Quarry a com-

paratively recent cableway of about 575 feet span lifting capacity of 12 tons. The winding machinery of the quarry cableway was shown on the plan, and was made by Messrs. John M. Henderson & Co., Aberdeen, who installed practically the whole of the quarry cableway in Aberdeenshire. There were two drums, 5 feet diameter for the hoisting and travelling ropes respectively, but were worked independently, so that the load could be hoisted without travelling when necessary. In travelling the load, however, the two drums were run together, the hoisting rope being wound on at the same speed as the endless rope was travelling. The engines had two cylinders of 11 inches diameter by 18 inches stroke, and were capable of lifting and travelling the load at speeds of 300 and 900 feet per minute respectively. In every case the winding machinery was placed close to the edge of the quarry, so that the operator had full command of the hoisting and was thus frequently at a considerable distance from the mast itself, in which case guide pulleys were used to lead the various ropes into the engine-house. Steam was the motive-power for the cableways at all quarries except Rubislaw, where they were electrically driven.

#### *Drainage of the Quarries.*

The pit-like character of the Aberdeenshire quarries precluded any natural system of drainage being adopted, and the whole of the water had to be raised to the surface by pumps. The usual practice was to excavate a sump at the extreme end of a "dip," and drain the water from the quarry floor to it. The drainage pump was placed on a ledge of rock a few feet above the level of the sump, and was housed in to protect it from damage by blasting falling stones. In the smaller quarries the pump was fitted up on a frame of timber sleepers, and was hoisted to the bank out of danger when shots were to be fired, or the way of operations. As a rule the smaller quarries did not have a great deal of leakage water to contend with, but larger and deeper quarries required more or less constant pumping. As the granite rock was practically impervious to water, a spell of wet weather or a period of thaw entailed heavy pumping. The type of pump generally in use was a horizontal, direct-acting steam pump, steamed from a central boiler-house at the quarry bank. The suction-

P. A. GILBERT WOOD, *Publisher.*

For Index of Advertisers, see page x.

short, and consisted of thick armoured rubber hose a long rose box, and could be adapted to a shallow or lar sump in the early stages of opening out a "dip." discharge main was of steel piping with screwed flanges, aded by wire ropes alongside the wall of the quarry. . 1 Quarry, Kemnay, where a large amount of water be dealt with, a direct-acting steam pump was used e of throwing 7,000 gallons per hour; and at Rubis-quarry a turbine pump by Mather & Platt, of Man-r, had recently been laid down capable of delivering gallons per hour to 400 feet at 1,360 revolutions per e, and was driven direct by a 60 horse-power shunt-electric motor at 440 volts.

#### *The Inclines.*

many of the Aberdeenshire quarries the materials owered to a main line of railway by inclines. Self-inclines were usual, but at Kemnay Quarries the main to No. 1 Quarry was worked directly by a steam-engine at the top. This incline accommodated the ns of the Great North of Scotland Railway, which auled up to the quarry from the main line and loaded y, connections being made between the main incline anch lines at the quarry bank by loops and waggon es. The incline ascended at right angles to the ne of railway, but was curved in the upper part, and e ropes were guided between horizontal and vertical fixed to the sleepers. A turntable was provided at t of the incline for assembling the waggons in the se sidings, which were laid out parallel to the main Of the self-acting inclines, that of Tom's Forest might be taken as generally typical. This quarry uated in the Alford Valley, near that of Kemnay, at it of about 370 feet above sea-level, and the materials owered by an incline about one-third mile long to ding bank at Ratchill siding of the Great North land Railway, a height of about 130 feet. The was partly straight and partly curved, and was t with steep gradients at top and bottom, and a at gradient between, the maximum and minimum its being 1 in  $5\frac{3}{4}$  and 1 in  $27\frac{1}{2}$ . The permanent way ed of three rails only, laid on cross sleepers, but a passing place or loop was provided in the middle

of the length of the incline, with complete double tracks. At the top and bottom of the incline the three rails con-verged into a single track of two rails, leading respectively to the quarry and to the loading bank alongside the rail-way. The machinery consisted simply of two horizontal pulleys, placed at the top of the incline, round which the hauling rope was coiled once, and were controlled by hand brakes. The empty train was attached to one end of the hauling rope at the foot of the incline and the full train to the other end at the top, and in descending the full train brought up the empty one. The hauling rope was guided on the straight parts of the track by horizontal rollers, and on the curved parts by horizontal and vertical rollers. The train usually consisted of three waggons each way, built with underframes, on which the iron skips were placed, or timber boxes lined with sheet-iron. The loaded train weighed about 12 tons and the incline worked exceedingly well, the minimum speed being 6 miles per hour on the flattest gradient of 1 in  $27\frac{1}{2}$ .

#### *Stone Dressing.*

Granite stone was cut and dressed at the Aberdeenshire quarries into large blocks for engineering and monumental purposes, ashlar for engineering and domestic building work and paving setts, while rubble stone, road metal and crushed granite were amongst the other products. After a blast a careful examination was made of the rock brought down with a view of obtaining the greatest quantity of saleable stone at the highest value. The large pieces were set aside to be cut into engineering and monumental blocks, and in descending order of size and quality the rock was apportioned to the various uses already enumerated. Large stones beyond the power of the lifting appliances, after being tumbled on the floor were split up into smaller pieces by a small charge of gunpowder or by "plug and feather," which consisted in boring a number of holes about  $\frac{5}{8}$ -inch diameter, 5 inches deep and 5 inches apart, and inserting therein a series of steel "plugs" or wedges between steel "feathers" or splints of steel for the purpose of wedging the halves of the stone apart. The line of the holes was selected with particular reference to the grain of the stone, as all Aberdeenshire granites had at least one easy way of splitting, which was in the direction of the grain, and some

Queen Anne's Chambers, Westminster, LONDON.**

had two, as at Kemnay. The "plugs" were driven simultaneously home by sledgehammers, and in large stones the "plugs" were assisted by a few longer steel wedges in deeper holes. The huge blocks which could be cleanly split in two by this simple method were remarkable, provided that the holes were well removed from the edges. The "plug" drilling was usually done by hand, but both at Kemnay and Rubislaw quarries compressed air hand-drills of the pneumatic hammer type were used. Stones for monumental purposes were usually long and thin, and the "plug and feather" method of splitting was not generally applicable. For such stones a small portable rock drill, mounted on a timber frame over the stone was used to drill the "plug" holes right through from side to side, at 5-inch centres, when the selvage could then be wedged off with certainty. Slabs of rock only 18 inches thick, 7 feet deep and 14 feet to 15 feet long could thus be successfully prepared, the holes being drilled the deep way of the stone, and leave little surplus material to be removed in fine dressing or polishing. Further dressing of stones, however, was not undertaken at the quarries, with the exception of those belonging to the Messrs. Fyfe, and the materials intended to be highly finished were sent to the Aberdeen and Peterhead stonecutting and polishing works, which formed a large and important part of the granite industry, quite separate from quarrying. At Messrs. Fyfe's quarries special facilities were provided for the preparation of stones of the largest dimensions for engineering purposes in the form of drafting floors and dressing sheds, and stones were despatched from their various quarries completely dressed and ready to be built into place. Stones for ashlarwork were split by "plug and feather" from the smaller size pieces of blasted rock, and blocked roughly to size by hammer, but were not further dressed at the quarry unless so required. The stone for granite setts was selected from the smaller rough materials, and was split by "plug and feather" on the quarry floor into blocks containing about enough material for two or three setts. The standard size of paving sett was 6 inches deep, 3½ inches wide and from 7 inches to 10 inches long; but other sizes were made down to cubes of 4 inches, or as ordered. Out of the blocks the settmaker formed by hand-hammer the nearest standard size of setts, taking

advantage of the natural cleavage of the stone as far as possible, but with a bad cleaving stone there was a large amount of waste, and the setts were correspondingly difficult to make. Small-size setts were more costly to make than large, as they could not be held properly, and was more waste of stone. The setts were deposited in separate heaps according to size beside the settmaker's, and were weighed upon a portable weighing waggon running on the quarry railways before being taken over by the master.

#### *Power Supply.*

The quarrying operations at the whole of the Aberdeenshire quarries, with the exception of Rubislaw Quarry, are carried out by steam-power, and the supply was obtained in most cases from a central boiler-house situated on the quarry bank. A main steam pipe was carried round the quarry bank to supply the hoisting and other machinery. Another main was carried down the face of the quarry to a convenient point to supply the machinery on the face. The latter main was of steel with screwed flanges, and was usually suspended by wire ropes, and formed a source of constant trouble from its inaccessibility. The long 1½ inch steam pipes also resulted in considerable loss of pressure, and as coal was a costly item owing to the long carriage, the supply of steam-power figured high in the quarry expenses. With a view to economy in this respect the proprietors of Rubislaw Quarry had recently converted their power supply from steam to electricity. Being advantageously situated in the suburbs of the city of Aberdeen, the supply of electricity had been taken from the Corporation without incurring the expenses of the initial cost of a generating plant and its subsequent maintenance. The quarry main was taken off the Corporation cable in the Corporation Road into the quarry offices close at hand, and is protected by automatic switches and metered before passing to the main switchboard, which is situated in the machine house of the 20-ton crane at the quarry. The distribution is made from the switchboard by bare copper wires, carrying a "ring main" round the quarry, carried on porcelain insulators, and distributed to the various machines at convenient points. The supply from the Corporation main is by direct current at 440 volts, and a total of 1,000 h.p. in machines has been installed.

NOTICE TO ADVERTISERS.

In no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

EDITORIAL NOTICES.

One of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

TENDERS, ETC.

\* \* As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

COMPETITION OPEN.

LONDON.—Oct. 14.—The Acton District Council invite architects who have been in practice for at least seven years to send in to Mr. Wm. Hodson, clerk, 242 High Street, Acton, W., before Oct. 14, designs for erection of the proposed Council offices, at a cost not exceeding 18,000l. An assessor will be appointed, and premiums of 100 guineas, 50 guineas and 25 guineas will be awarded for the designs selected by the Council after their consideration of the assessor's award. Particulars can be obtained upon the payment of 10s. 6d.

THE Rev. P. P. Goldingham, the vicar of Buckingham, in announcing in his "Parish Magazine" the retirement of his curate, states:—"In trying to replace his good colleague he has had to refuse three good men simply because he cannot find a house for a married clergyman to live in. Four or five bedrooms and a bath-room ought not to be a demand too great for any place to supply in the present day, but it beats Buckingham entirely. The consequence is that the curacy is not filled up, and there appears very little chance of it being so, at any rate for the present." The reverend gentleman asks if it would not be worth while for a few Churchmen to join together and build a house for a married curate to live in.

## TRADE NOTES.

WE regret that in our notice of the awards made at the Congress on School Hygiene at Kensington, through clerical error, it should read that Messrs. Bratt, Colbran & Co. were awarded a bronze medal for their heated fireplace. This should, of course, read, their well-known patent "Heaped fire."

MESSRS. REDPATH, BROWN & Co., LTD., London, Edinburgh, Manchester and Glasgow, have taken over the contract for the supply and delivery of the steelwork for a new mill for the Wallpaper Manufacturers, Ltd., at Greenwich. The order, amounting to over 2,000 tons, was originally placed with Messrs. Milliken Bros., of New York, but the whole of the structural steelwork is being executed by Messrs. Redpath, Brown & Co., Ltd., at their London and Edinburgh works, delivery being made at the rate of 50 tons per month.

A LARGE new clock has been erected on the church of Arnesby, near Leicester, which shows time on one dial, chimes the quarters on four bells and strikes the hours. It has been made and erected by Messrs. John Smith & Son, Midland Clock Works, Derby, generally to the designs of the late Lord Grimthorpe.

MESSRS. GEORGE MILLS & Co., engineers, Radcliffe, near Manchester (the proprietors of the "Titan" sprinkler), have received the following letter from Messrs. The Shannons Ltd., Ropemaker Street, Finsbury Pavement, E.C.:—"We are glad to inform you that your sprinkler system has again done most useful work at our factory at Dalston, on the 1st inst. Were it not for the prompt alarm and the excellent action the fire would have proved a most dangerous one, as that particular department was crowded with special work almost ready for delivery, and we think it is only right that we should inform you of this. The fire was quite extinguished before the brigade arrived."

THE Colne Town Council have decided upon developing their electrical plant by expending about 5,500l., and upon laying down filters, &c., at the Laneslaw reservoir at a cost of 2,500l. An application to borrow the requisite amount will be made to the Local Government Board.

## VARIETIES.

Prescot Board of Guardians have agreed that a new rate building be erected at a cost not to exceed 9,000*l.* to accommodate about 100 mental, epileptic and infectious cases.

A MOVEMENT is on foot to arrange for a meeting between the whole of the forty-two guilds of the City of London, the idea of seeing what sum could be raised by them towards the 100,000*l.* which is needed to save Crosby Hall.

MR. CLYNES, M.P., has given notice to ask the President of the Local Government Board whether the Manchester Corporation have submitted to his Department new building-laws; whether he can state why they have not been framed; and is he aware that similar by-laws have for years been in force in Levenshulme, a suburb of Manchester.

THE clerk of the works at Selby Abbey while engaged moving the tie beam ends which were embedded in the walls, and which had previously supported the ringing floor, was employed to inserting the steel joists in their places, discovered that the charred ends retained visible evidences of a distinguished fire. The remains were quite hot and when stirred the ashes emitted smoke, accompanied by the smell of burning wood. This unseen danger had, as it were, smothered for nine months.

In order to avoid litigation, the Bath City Council and the District Council have given a joint promise to the Somerset County Council that they will in future not send the sewage of their respective districts into the river Avon. New sewage disposal works of large extent will be constructed between the city and Bristol. No decision has been decided upon as yet, but it is expected the effluent will be allowed to run by gravitation into low land to be acquired near Salford, and that the cost of the work will be between 800,000*l.* and 1,000,000*l.*

MR. W. A. DUCAT, Local Government Board inspector, called at the town hall, Sheffield, on Tuesday, for the purpose of inquiring into three applications by the Corporation for borrowing powers. The largest of the applications was for power to borrow 26,548*l.* for works of

paving. A number of streets which are at present paved with boulders, old gritstone setts, or other unsatisfactory materials are to be put in better repair. Most of the streets will be paved with granite cubes and setts, and some with gritstone setts.

MAJOR J. STEWART, R.E., held a Local Government Board inquiry at Aston last week concerning the application of the Aston Corporation for power to borrow 17,519*l.* for the purposes of a scheme to supply electricity within the urban district of Erdington. The Inspector also inquired into an additional loan of 1,650*l.*, required by reason of the necessity to substitute the cables from Aston Cross to Salford Bridge, in order to supply the demand created in Witton by certain large manufacturers, and also by the Tame and Rea Drainage Board.

HIS MAJESTY'S CONSUL at Bilbao (Mr. A. Maclean) reports that a depression has been noted in the iron ore trade in Bilbao during the past few months. Great difficulty is experienced in selling abroad at the prices insisted on by the mine owners, and it is feared they will have to reduce their rates considerably before a frank revival in exports can be obtained. A Bilbao merchant who visited Stettin works lately found they were bringing rich ore (67 per cent. metallic) from the Ural mountains at a cheaper proportionate price than they could buy at Bilbao.

THE Ballachulish slate quarries, which are the largest in Scotland, employing about 300 hands, and the sole industry on which a population of 1,800 mainly depends, have been closed indefinitely. The reasons for this state of affairs are attributable to the unwillingness of the Quarries Company to spend any more money on the enterprise, and the refusal of the men to work on terms which would reduce their present low wages to vanishing point. The quarries closed presumably for the usual summer holidays on the 11th ult., but without the masters fixing any date for reopening the works.

MESSRS. CARRERE & HASTINGS, of New York, have completed plans for the beautifying of Atlantic City, U.S.A. The first scheme is the development of a civic centre. It is proposed to establish a large square, the new station of the Pennsylvania R.R. to be on one side, a new city hall on the other, and smaller municipal buildings around these;

next in importance is the drainage canal, which has been authorised by the City Council. In the development of the boardwalk it is proposed to follow the present lines, but to carry the ocean side on arches of concrete, to introduce proper electric lighting, and to construct for the convenience of visitors pavilions and shelters.

An inquiry was held last week by Mr. Richard O'Brien Smyth, Local Government Board inspector, in the South Dublin Union Workhouse into the propriety of a scheme promoted by the South Dublin District Council for the erection of seventeen labourers' cottages at Clondalkin, of one storey each, having four rooms and half an acre of ground attached. The total cost of the cottages will be 3,390*l*. At a meeting of the District Council subsequently held, a petition was adopted asking the Local Government Board to confirm a scheme for the building of labourers' cottages all over the rural district to the number of 285, at a cost of 58,000*l*.

The Chesterfield Town Council have passed the following resolution:—"That it be an instruction to the committees of the Council in all cases in which direction is given for tenders to be obtained, either for the erection of works, for the supply of materials, or for any articles to be provided in connection with the several undertakings of the Council, to require that all such tenders shall be sealed and sent direct to the clerk of the Council, and that no tender be opened by any person other than at a meeting of the committee dealing with the particular matter in question."

Mr. EDGAR DUDLEY, F.S.I., Local Government Board inspector, held an inquiry on the 9th inst., at the Birmingham Council House, with reference to the application of the City Council for sanction to borrow 4,250*l*. for the purchase of a site for a fire-station at the corner of Albion Street and Legge Lane, in the jewellers' quarter. In 1897, out of 546 fires which occurred in the city, 149 were in that district. Last year the number of outbreaks in the jewellers' quarter numbered 208 out of a total of 659. The district is served by the central station, and it takes seventeen minutes to get from the central fire station to the site of the proposed sub-station. It is proposed to expend 13,250*l*. on land and buildings.

The Manchester waterworks committee have considered the recent decision of the Council that the minimum wages

of all labourers must be 25*s*. per week. A number of men employed at Thirlmere and elsewhere receive a wage sent less than 25*s*., but the committee have taken the hitherto that living in the water-gathering area is cheaper than in the city, and that this should be taken into account. The raising of all these employes to 25*s*. per week would considerably increase the wages list, and a sub-committee to inquire what changes will be necessary. The committee may have to meet the situation by a limitation of holiday concessions, and one result may be the letting of work to contractors which hitherto has been done under the supervision of the committee's own officials.

At the last meeting of the Mersey Docks and Harbour Board the works committee recommended the acceptance of a tender for the supply of five roof cranes for the storey shed on the south side of Sandon Dock. The committee had had considerable discussion as to whether they should have electric or hydraulic cranes. Mr. Lyster, engineer, had no difficulty in persuading the committee rather the committee generally believed, that hydraulic cranes were better for the Board's purposes than electric. Besides, they had the further advantage that the initial cost was only about two-thirds that of electric cranes. In accordance with standing orders, consideration of the recommendation was postponed for a week.

The Swansea Harbour Trust on the 9th inst. decided that the contractors should be instructed to excavate the site of the land available for extension in the future to the extent of half a million cubic yards. This will involve an outlay of about 25,000*l*. The executive committee considered the equipment of the new dock, and it was decided to advertise for tenders for twenty 2-ton cranes and one 10-ton crane. The general manager submitted a statement as to the advisability of carrying out an extension of the new dock at the eastern end, which had been referred to as likely to be useful in the event of Cammell, Laird & Co. locating proposed Welsh works in the district. This will involve an outlay of about 90,000*l*. The trustees felt that the carrying out of such an important work would furnish a powerful inducement to some large firm or firms to erect works at the Burrows, where sites are available, and will be adjacent to the extension. Having regard therefore to the fact that the work can be carried out at present more

later, it was decided to give the contractors instructions to proceed with the work.

A PUBLIC illuminated clock, which has been placed in front of the gable of the Harold Club at Low Moor by members, as a memorial of the late Lord Cranbrook, set going by the Earl of Cranbrook at 8 o'clock P.M. on day last, the 12th inst., before a large number of members, and spectators, Mr. Laurence Hardy, M.P. for Ford Division, Kent, Mr. H. B. Woodcock, Mr. Walter H. chairman, and Mr. H. Laycock, secretary. The clock was built and fixed by William Potts & Sons, clock manufacturers, Leeds and Newcastle-on-Tyne, from the plans of the late Lord Grimthorpe, and will be a great boon to the inhabitants and Bradford City trams, which run close to the front. Messrs. Potts are fixing several more clocks in the district.

CERTAIN members of the Dundee Harbour Trust last week visited Manchester and Liverpool to inspect the plans and obtain information which might be of value in considering the question of the reconstruction of the harbour at the east end of the harbour and the erection of new wharves. The draft report concludes:—Your representatives have greatly profited by their visit to these two great ports. They have seen buildings, equipment and the most modern of dock appliances. They were much impressed with the magnificent range of ferro-concrete wharves erected alongside No. 9 Dock at Manchester. These wharves seem admirably adapted for the purpose. They occupy space very considerably, are capable of storing immense quantities of all kinds of goods, and can be most efficiently supervised and worked cheaply. They are fire-proof throughout. It is believed that sheds of similar construction, but possibly of a less height, would be eminently suitable for the western and eastern wharves at Dundee, and it is suggested that the trustees should consider the expediency of reconstructing the jetties, beginning with the western wharf, in ferro-concrete, and of erecting on them sheds of similar material fitted with the latest type of electric or hydraulic cranes for the expeditious discharge, loading and delivery of cargoes. If some such scheme were carried out the trustees would have at their disposal a immense amount of storage accommodation.

## THE FOUNDRY TRADE.

THE Annual Convention of the British Foundrymen's Association was held recently in Sheffield, under the presidency of Mr. Herbert Pilkington, M.Inst.C.E. In the course of his address, according to the *Derbyshire Courier*, he said that Sheffield was the home of the steel trade, and, what was more interesting to them as foundrymen, the home of steel castings. In the city, steel castings of every type were made—crucible, Siemens and Bessemer—and there was no place in this country, or any other so far as he knew, where that industry was so large and so deeply rooted. Over the county border in Derbyshire they would have the opportunity of seeing, amongst other things, the manufacture of cast-iron pipes, which in that county had become more highly specialised than in any other part of England owing to the construction of special tackle, special handling plant, and the organised classification of work. They would also see pipe foundries, general foundries and engineering shops wholly driven by power derived from blast-furnace gases. He had been charged with being a pessimist with regard to the iron and steel of this country, a criticism with which he had no desire to quarrel, inasmuch as the charge was somewhat mistaken. In particular he was no pessimist with respect to their foundry trade, neither were any of them in the Sheffield district pessimists on that point. He believed that the English founding trade in both iron, malleable iron and steel, had a great future before it. England was a great engineering country, and with its development in mechanical engineering, constructional work, engine and ship-building, he could only see a large and increasing trade before them in foundry work. What he was pessimistic about, the President went on, was the antiquated methods and the antiquated spirit with which, for the most part, they dealt with the manufacture of castings of all sorts. Although there were excellent exceptions, it appeared to him that there was no department in the great iron and steel trades which was so behindhand, not only in commercial methods but in mechanical arrangement, systematic organisation and scientific methods as was the ordinary foundry. What was needed in English foundries was for them to "wake up," and it was the duty of an Association like theirs to wake up

founders by such criticism and teaching as they were of capable. Although England exported thousands of tons of foundry pig-iron annually to Germany and other parts of the Continent, it was clear that Germany alone made something like double the amount of iron castings England did. Speaking more particularly of foundry methods, he pointed out that it was frequently stated that if six different firms in this country were asked to tender for any line of castings they would never fail to get one tender out of the six at such a price that the castings were bound to be made for something less than the cost of production. There was no doubt whatever that there was a grave element of truth in that statement. It clearly showed that the organisation and perfection of casting and estimating was in a very unsatisfactory condition. In the ordinary engineering works the foundry and foundry affairs were relegated to a subordinate position, and generally regarded as an objectionable, if perhaps a necessary department. There was no place, however, where systematic organisation and specialisation was more distinctly necessary than in the foundry. The ordinary jobbing foundry, whether suitable or otherwise for the work, often attempted all sorts of castings. Its products were so miscellaneous that generally the work was hopelessly confused with regard to the detailed cost of production, and therefore the founders were not in a position to properly estimate and make out tenders based on previous experience. After all, the first element of success was to be found in cost keeping within the foundry itself, the President said, and he argued strongly for the working out of the exact cost of each different job so as to provide a correct estimate and fairly accurate basis for tendering for other work. Specialisation of the production of castings would necessarily be one of the features of foundry development in the future. There was a tendency to confine the manufacture of a particular type of casting to particular shops, properly constructed and arranged for the purpose, or to build the whole foundry for a particular type of casting, and merely use different shops of different handling capacity for the different weights of castings made. Wasters were often the cause of much misplaced energy, not to speak of language in all foundries, but he thought that in most instances the production of wasters might be very much diminished

by an organised study of them. A proper "waster book" ought to be kept, and every waster recorded, and the number or name of those who made the waster, together with the type, the cost of its production, or the particular invention made with regard to it. Generally speaking, so far as foundrywork was concerned the study of various statistics carefully compiled, dealing with costly tackle, boxes, bars and other tackle, would amply repay all the cost and trouble it would entail. Perhaps the greatest advance in this country in regard to foundrywork, and particularly in the founding, had been the increased attention paid to the study of the metallurgy of cast-iron. There was still an immense amount of work to be done on the subject of cast-iron compared with steel, but it was a good omen for the future that so much had already been accomplished. Not only a large amount of research work had been accomplished, but a great deal was in progress at the present time. The attention of the chemist and metallurgist in the foundry had in every case been immediately productive of better results, owing to the fact that metallurgy had first of all to be adapted to the circumstances and conditions obtaining in the work, perhaps more frequently because it was a long time before a foundry manager or foreman was able to appreciate the value of such work. Every foundry manager, however, ought to be such a practical student of metallurgy as would enable him, at all events, to apply the work of metallurgists in a systematic and practical way in the foundry, because obviously, the manipulation of such matters must rest with the foundry chief, although he must be guided by the analysis and other work of the metallurgist. Another subject they would surely have to make up their minds to take up was in respect to the inspection of castings and the methods in which they were composed. In pointing out a few of the defects existing in the foundry system and organisation, the President said in conclusion that he was quite well satisfied that foundries existed which were above criticism and reproach, and that during the last few years immense steps had been made. They did not give precedence to the country in the excellence and soundness of their products, and British castings were still the envy of the world. He hoped that position would be maintained, and that England might also excel in the scientific and systematic method of production in every way.

# ICE PROBLEM IN CANADIAN ENGINEERING.\*

In Canada the physicist has excellent opportunity to study on a grand scale the operation of the natural laws governing the formation of ice in the many forms met with in the large and often turbulent rivers. To the engineer the problem is more serious, for the development of the vast water powers of the country must include means for combating the ice troubles which arise each winter. The conditions which must be met during the winter months are sometimes very serious, when ice is forming rapidly, and ice-bridges, dams and shoves may change the whole character of the levels and channels in a single night. Rivers are known to have been turned entirely out of their course to seek new channels during a winter of unusual severity, and in some instances the reversal of a rapid is of early occurrence. Nowhere can one witness a more wonderful sight of the delicate poising of the forces of nature than in one of the Canadian rivers in winter. The readiness of the temperature of the water throughout the season is a matter of great interest. It seldom varies more than a few thousandths of a degree from the freezing point even in the severest weather. This is true for rivers flowing too swiftly for surface ice to form, as well as for the quieter streams protected by an ice covering.

In general three varieties of ice are distinguished, and present characteristics brought about by their method of production. Surface or sheet ice forms over the surface of lakes or rivers, and is helpful or not, depending on the particular conditions. Spicular ice, or as it is called in Canada, frazil ice, is formed by surface agitation in the more turbulent rivers, and in waterfalls, and accumulates in great quantities in the quieter portions of the stream where it is carried by currents. It varies in size from thin needles to fine needle crystals depending on the degree of agitation of the water, and of all the forms of ice it gives the most trouble in hydraulic work. Anchor or ground ice is the most interesting form on account of the fact that it grows along the bed of a river which is not covered by a

surface sheet. It is formed in two ways: by the cooling of the bottom by the radiation of heat during cold clear nights and by the freezing of frazil ice carried down by the currents of water when in a supercooled state. A bright sun has a great influence on the ice, and as soon as its rays are sufficiently high to penetrate to the bottom, the ice is detached and rises to the surface. In so doing it frequently brings up stones or boulders of considerable size to which it is attached.

A study of the temperature conditions in the water during the production of these forms of ice shows that the freezing is accompanied by a small temperature depression in the water, amounting to a few thousandths of a degree from the freezing point. During severe cold weather the water is thus thrown into a slightly supercooled state, during which time the ice crystals grow rapidly by continued freezing and give rise to the agglomerating stage, when they possess adhesive properties and form lumps and spongy masses. In this condition the ice is dreaded by power users, for it quickly adheres to the rack-bars and to the machinery of the wheel-gates and turbines. In a short time it interferes with the operation of the wheels and may at any moment cause a temporary cessation of operations. Fortunately, it is only a minute temperature depression which brings about these conditions, and methods of artificial heat applied about the affected spots relieve the situation in a short time. An intelligent use of artificial heat, specially at night time when supercooling is most common, is found valuable in preventing any interference with the normal operation of a power-house. It is not necessary to warm the entire volume of water passing through, which would be very costly and difficult, but by applying the heat in the racks or wheel cases, or blowing steam about the affected parts, the ice is prevented from obtaining a foothold. The ice is as effective as so much water in producing a head, hence the necessity of passing it through, and never allowing it to freeze to the metal surfaces of the machinery. It is safe to say that where it is possible to apply even a small quantity of heat directly to the machinery and racks, a condition of affairs may be done away with which for many years has been regarded as involving inevitable interruption to the continuous operation of a plant.

There are other causes at work, however, to interfere

A paper by Mr. Howard T. Barnes, D.Sc., F.R.C.S., Associate Professor of Physics, McGill University, Montreal, read before the British Association.

## THE "DRAWWELL" GRATE

WAS PLACED

### First in the Final Tests

at the recent test with Firegrates at the New Government Offices in Whitehall, under the direction of a sub-committee of the Coal Smoke Abatement Society, in conjunction with Sir Henry Tanner and a committee of experts, for smoke abatement, heating power, fuel economy, and suitability for public and private buildings.

**N.B.—All Grates bear the Trade Mark and Name of "Drawwell" on firebrick to insure against imitation.**

This Grate can only be supplied through Builders' Merchants, Ironmongers, &c., but Drawings and Particulars can be obtained from

**J. & R. CORCKER, Ltd.,**

W. B. CLARKE, Agent, where the "Drawwell" can be seen in action.

with the operation of power plants, which depend on the particular spot where a power-house is located. Rivers like the St. Lawrence at Montreal are subjected to winter floods, occasioned by the accumulation of frazil and disintegrated anchor ice. Wherever open water or a rapid occurs above a surface sheet of ice, large quantities of frazil ice are carried under by the currents and settle upwards in the quieter parts. Large hanging dams of spongy ice are thus produced, which so reduce the available waterway as to cause serious changes in level. Sometimes the channels become blocked entirely, and then the water backs up sufficiently to clear the ice away and produce a shove. A tremendous upheaval results, and large masses of ice are piled on high for miles round, often doing much damage.

It is well known that the most effective prevention to the formation of both frazil and anchor ice is the protection afforded by a surface sheet of ice. If a power-house is located on a river normally frozen over, with no stretches of open water above, no ice troubles are experienced. When this is not possible, artificial canals are usually constructed, in which the water flows sufficiently slowly to freeze over. If the canal is fed from the open river, booms and crib-work are resorted to in order to deflect much of the ice. If the inflowing water current is sufficiently rapid to draw the frazil under the surface ice, it is often necessary to cut artificial channels to allow of sufficient water for the wheels. Thus a surface sheet may prove to be disadvantageous. So many and varied are the conditions to be met with in the location of a power-house that no set of rules can be given to meet the general case. It is only by a thorough knowledge of the laws underlying the formation of ice that means may be found to cope with any particular situation. It may safely be said, however, that the ice problem in Canada is no bar to the future development of her vast water-powers.

#### BUILDING GRANTS FOR SCHOOLS.

The following regulations were issued this week by the Board of Education in regard to grants for the building of new public elementary schools in England and Wales:—

After the passing of the Appropriation Act, 1907, the

Board of Education will, during the financial year ending March 31, 1908, make grants, in circumstances which the Board's view will render such grants expedient, in of the building of public elementary schools provided local education authorities in accordance with the following regulations. Applications for these grants may be made to the Board by any local education authority, and the Board will also consider and bring to the notice of the local education authority concerned any cases brought before them by minor local authorities or by parents.

1. No grant will be made in respect of any building enlargement for which the building contract was signed before August 1, 1907.

2. The grant may be paid in respect of the acquisition of sites or the erection of buildings or the enlargement of existing buildings.

3. The grant, which will be payable to local education authorities only, may be for a proportion, or, where the Board think fit, for the whole of the expenditure incurred for the provision of the site and building. Any question to the allocation of the grant arising in connection with section 18 (1) (c) of the Education Act, 1902, shall be determined by the Board.

4. The building in respect of which the grant is paid must be clearly distinguishable from any neighbouring buildings.

5. Except in the case of temporary buildings a grant will not be payable in respect of a leasehold site where freehold site can be obtained, and no lease should be for a shorter time than seventy-five years.

6. The plans must be approved by the Board.

7. The Board will require an undertaking under the seal of the authority that the building in respect of which the grant is made under these regulations will not be used for purposes other than those of a public elementary school at any such time or in any such manner as will interfere with the work of a public elementary school. The undertaking must bind the authority to refund, in the event of the Board so requiring, the whole or part of the grant if this condition ceases to be satisfied, or if the school ceases to be recognised as a public elementary school.

8. The provisions of sections 8 and 9 of the Education Act, 1902, must have been fulfilled, so far as they apply

for any grant is paid under these regulations; but on the expiration of the three months' notice required by section 8 of that Act in the case of new schools, the Board will be prepared to pay a grant under these regulations in respect of any sums, whether paid by way of instalments or otherwise, which may have been actually disbursed from time to time by the local authority between August 1, 1907, and March 31, 1908, in respect of the provision of sites or buildings in accordance with these regulations, and which are approved by the Board for the purpose of calculating a grant; but no grant will be payable under these regulations after March 31, 1908, unless a similar grant is sanctioned by Parliament in respect of the financial year ending March 31, 1909.

9. The Board must be satisfied that the accommodation to be provided, whether by permanent or temporary premises, is necessary within the meaning of section 9 of the Education Act, 1902. In considering this point the Board must, *inter alia*, be satisfied by the submission of satisfactory evidence that the parents of not less than thirty children of school age desire accommodation in a public elementary school provided by the local authority, and that the only existing public school accommodation of a permanent character available for those children is not so provided. In no case will a building grant under these regulations be payable in respect of school places which are needed to make good a numerical deficiency of public elementary school accommodation, and which the local education authority would therefore (in the absence of other proposals for supplying that deficiency) be obliged in any case to provide.

10. The decision of the Board as regards the interpretation of these regulations is final.

### CORROSION OF IRON.

At the recent meeting of the American Society for Testing Materials, Dr. Allerton S. Cushman, of the United States Department of Agriculture, made the first public announcement of the very interesting investigations he has been carrying on for several years on the causes which underlie the corrosion of iron. A number of new points were brought out, among which the most startling are that

oxygen plays only a secondary rôle in the rusting of iron, and that the best preventatives of rust are to be found among the most effective oxidising agents known, such as chromic acid and its salts. This view is so contrary to all previous conceptions, says the *Engineering Record*, that it is naturally received with some incredulity when first heard, yet those who are familiar with the investigations and conceptions upon which the new theory of corrosion is based are of the opinion that the evidence which has been brought forward is not only convincing but conclusive.

The fact that chromic acid and its salts act as inhibitors of rusting has been known for some time, but no explanation of the curious phenomenon has ever been offered heretofore, nor has its application to practice ever been suggested. Dr. Cushman has made a special study of this problem, and although it remains to be seen what practical benefit may develop out of these new ideas, it is most gratifying to be able to state that if any patents are granted covering rust inhibitors they will be taken out in accordance with the practice of the Department of Agriculture so that they will be free for all American citizens.

If a text-book is consulted for an explanation of the rusting of iron it will be found that carbonic acid has heretofore been generally held responsible for the formation of rust. Iron is supposed to be attacked by carbonic acid, with the formation of carbonate, which is then acted on by water and the oxygen of the air to form the red hydroxide known as rust, the carbonic acid being again set free to take up its destructive work. According to this theory, in an atmosphere which did not, like that of this earth, contain about  $\frac{1}{100}$  of 1 per cent. of carbonic acid, the rusting of iron would be an unknown phenomenon. That this, as well as the peroxide hypothesis which has lately been developed in England, must be relegated to the dump pile of abandoned theories seems to be conclusively shown by these latest researches.

According to the electro-chemical or electrolytic theory which Dr. Cushman upholds, the first attack on iron is not made by oxygen, even in the presence of water, but by hydrogen in the form of the hydrogen ion. According to the modern theory of solutions, many substances when dissolved in water are dissociated into ions, which may be regarded as atoms carrying static electrical charges. Water

itself, even when pure, contains a certain proportion of hydrogen ions, and the presence of many impurities, especially those which are by nature acid, increases the hydrogen ions and thus the tendency to attack iron and carry on corrosion. The action is entirely electrolytic, being continually accompanied by an exchange of the electro-static relations between the iron and the attacking hydrogen. Such oxidising agents as the chromate and bichromate of potash inhibit rusting by polarising the iron to the condition of an oxygen electrode, thus preventing the approach or attack of the hydrogen ion. One of the most extraordinary points brought out is that this polarisation effect is to some extent lasting. That is to say, if iron is immersed or "pickled" in a concentrated solution of bichromate acid and is then washed and wiped, it is rendered passive, so that it resists electro-chemical attack whether this take the form of rust formation or the well-known plating out of copper which takes place if the chromated specimen is immersed in a dilute solution of copper sulphate. In short, the action which goes on when iron rusts is in every respect analogous to that which takes place when iron is immersed in a solution of a copper salt. In the latter case, copper ions carrying positive electro-static charges are present, iron passes into solution and assumes the electro-static charge, while copper plates out and becomes visible. When iron rusts, iron passes into solution while hydrogen "plates out." Once in solution the oxygen of the air oxidises the iron to the insoluble form of the red hydroxide known as rust. This electrolytic action can be shown taking place by the use of a special polar indicator which has been called "ferroxyl." It follows from this that anything that will inhibit electrolytic action will act the part of a rust preventive.

To what extent the various salts of chromic acid will come into use for the treatment of boiler feed waters and for "pickling" structural material will depend upon experiments carried out on a large scale. Dr. Cushman himself is emphatic in pointing out the necessity for care and conservativeness in approaching the practical application of these purely scientific investigations. One of the modern problems in boiler practice is the rapid corrosion of boiler tubes used in connection with turbine engines. The copper which is dissolved by the action of the steam jets impinging on the bronze blades of the turbine rapidly corrodes the

iron in the boilers by the electrolytic action just described. Since it has been found that the presence of bichromate feed water will prevent this action, it seems as though a solution of this important problem has been discovered. The engineering world will eagerly await the detailed publication of Dr. Cushman's researches, as well as the results of the practical tests which are sure to follow.

#### NOTICES TO TRAVELLERS.

THE case *Wilson v. Dobbins*, which was tried on the 11th inst. at the Westminster County Court before his Honour Judge Woodfall, sitting with a jury, involved a question to the length of notice to which a commercial traveller is entitled. Mr. C. E. Jones was counsel for the plaintiff, Mr. C. J. Mathews represented the defendant. It appeared that the plaintiff was engaged in the year 1904 by a company then known as the British Prismatic Light, Ltd., afterwards called the Maximum Light Window-Glass Company, of which the defendant was managing director, and that he afterwards acquired and carried on the company's business and retained the plaintiff in employment. The plaintiff was paid weekly a salary and travelling expenses, but there was no agreement between the plaintiff and the defendant as to what length of notice was to be given to determine the employment. In the early part of this year the defendant gave the plaintiff a week's notice, against which the plaintiff protested. The defendant then seems to have consulted a solicitor, whom he was advised to give the plaintiff a month's notice, which he did. The plaintiff, however, still protested that this was not a reasonable notice, and the defendant having insisted that the employment was terminated, the plaintiff brought this action claiming damages for wrongful dismissal. There was no suggestion that the plaintiff's work had not been done thoroughly well, and ultimately the jury, after consultation, found that he was entitled to three months' notice, and his Honour the judge gave judgment for 32*l.* 1*s.* 6*d.* being thirteen weeks at 2*l.* 10*s.*, the amount of the plaintiff's salary.

**TRADE NOTES.**

THE Lydney elementary schools have been ventilated on the Boyle natural system, under the direction of Mr. W. H. Medland, county architect, Gloucester.

MESSRS. E. H. SHORLAND & BROTHER, of Manchester, are supplying their patent Manchester grates, exhaust roof ventilators and special inlet ventilators to St. Michael's schools, Wakefield.

THE tower of the Congregational church, Westborne, Bournemouth, has just been completed. The whole of the Monk's Park stone used has been supplied by the Bath Stone Firms, Ltd. Mr. F. Stevens, of Bournemouth, is the architect, and Messrs. Jones & Seward the builders.

THE chapel, Upper Parkstone, Bournemouth, is nearly finished, Messrs. Lawson & Reynolds, of Bournemouth, being the architects, Messrs. Jones & Seward the builders, and Messrs. J. W. Mannell & Co. the masons. The whole of the Corsham Down stone was supplied and worked by the Bath Stone Firms, Ltd.

THE Excelsior Patent Stone Company have a stand at the exhibition of urban cottages at Garden City, Letchworth, Herts, facing the exit from the railway station. The company were awarded a diploma for their exhibits at the cheap cottages exhibition held in 1905. The floor of the stand is paved with their 12-inch by 12-inch octagon slabs with black Staffordshire quarries in the corners (a suitable paving for lobbies, entrance paths, porches, &c.), grooved stable paving slabs and channel and ordinary 2-inch thick paving slabs as supplied for sidewalks. The stand is edged with their kerbing and combined kerb and channel, which is largely used by county, rural and urban authorities. They are also exhibiting the "Whitbread" window sill of registered design, a moulded window head, and a mantlepiece set suitable for cottage work, besides copings, steps, &c. The exhibits are of particular interest to those requiring a strong, durable, inexpensive material of pleasing appearance. The stone resembles best blue York stone, the cost, however, being one-third less.

MR. CONSUL JEROME in his report on the trade of Mexico during last year says:—I have often drawn attention to the development of electricity in Mexico. In my report for 1899 I indicated the demand for electrical appliances—electric lamps, incandescent or arc lights, high and low tension cables for transmission lines, dynamos and motors, either steam or water driven—in fact, all kinds, and I can only repeat this. Many of the tramway systems are being altered from animal power to electric power, and it should be borne in mind that there is hardly a town of any importance in the country that has not got a tramway system. Factories, too, are largely using motors with direct connection, instead of the overhead system pulleys and belting for power transmission to machine tools. I have up to the present not seen a single British-made motor or dynamo in Mexico, and only a few of German manufacture; nearly all the electrical appliances used up to the present in this country are American. The expansion of the cities, notably the capital and Guadalajara, offers opportunities for building material, hardware, glass, sanitary goods and similar articles.

was announced on Monday that the Butts Spinning  
pany, Ltd., is to erect a new factory at Leigh, with  
capital of 100,000*l*.

THE Hampton District Council have decided to erect a  
destructor, and have accepted a tender for the work.  
application will be made to the Local Government  
for permission to borrow the money required.

THE town clerk of Bolton, Mr. S. Parker, has submitted  
awards of the umpire in the recent arbitrations as  
follows:—Mr. E. Deakin *v*. Bolton Corporation, 8,197*l*, the  
claim being 50,000*l*; Deakins, Ltd., *v*. Bolton Corporation,  
claim being 20,000*l*.

THE Home Secretary having declined to advise His  
Majesty to grant the application of the Urban Council at  
Sittingbourne to rename that town Milton Royal,  
Council are now seeking to adopt the appellation of  
Milton Regis. To this proposal the Home Office offers no  
objection.

THE City of London Corporation earned last year on its  
working-class dwellings a net profit of 123*l* 12*s*. 2*d*. The  
aggregated 5,965*l* 10*s*., and on the debit side of the  
account the principal items were:—Special repairs, 1,195*l*; interest  
on loan, 2,190*l*; rates and taxes, 1,590*l*; wages,

ACCORDING to the report upon the trade of the United  
Kingdom for last year, furnished by the British Commercial  
Commission, there is always a good demand for decorated ware,  
large quantities come from Germany. British houses  
trading for cheap, showy goods ought to be able to do an  
equal trade. To do a successful trade it is necessary to

send articles having the appearance of being better than  
they really are.

THE medical officer of health (Dr. J. F. J. Sykes) to the  
St. Pancras Borough Council reports that at the end of the  
last municipal year there were 538 underground dwellings  
in the borough registered as illegally occupied, and which  
had been ordered to be closed. Time was allowed for the  
occupants to find accommodation elsewhere, pending which  
the premises were subjected to strict supervision.

JUDGE SHERSTON BAKER and a jury spent some time at  
the Grimsby Palace Theatre on the 15th inst. experimenting  
with the fireproof curtain. When the curtain was being  
lowered after a charity performance some time ago the  
cables snapped, and the counterpoise weights, weighing  
half a ton, fell 40 feet upon the stage manager and killed  
him instantly. His widowed mother now claimed compen-  
sation. The jury, after their inspection of the mechanism,  
awarded her 150*l*., saying that such weights ought to have  
been cased in.

OPERATIONS at Rosyth naval base in connection with the  
sinking of the caisson are being prosecuted vigorously.  
The cylinder has reached a depth of 53 feet; it rests on a  
bed of sand, strong clay forming the strata immediately  
above. The contract depth to which the caisson was to be  
sunk was 40 feet, but it is intended now that the sea bottom  
will be penetrated to a distance of nearly 80 feet. In the  
district a rumour has gained considerable currency to the  
effect that offers for the construction of the docks will be  
accepted in October.

It has been definitely announced that, after considering  
various suggestions, the Admiralty have decided to build  
the new lock in Portsmouth Dockyard on the site chosen  
by their own engineers. The lock, which will be 850 feet  
long and 110 feet wide, will be cut through between the  
tidal basin and No. 3 basin, on the north side of the north  
and south locks and parallel with them. The cost of the  
work will be a million of money. The plans of the new  
lock are those which had been originally prepared by the  
Admiralty officials.

DR. REGINALD DUDFIELD, medical officer of health of  
Paddington, reports:—"In the absence of any standard of  
comparison, it is perhaps difficult to arrive at a definite

conclusion, but the records of the past three years appear to justify the opinion that less smoke of all kinds is emitted from the 'commercial' chimneys in the borough. This is a gain, not only to the health of the residents and amenities of the district, but also to the consumers of fuel, as smoke represents waste. As regards the question of standards, experiments are about to be made by the local public health department with a view to utilising photography to record the actual emissions in comparison with empirical standards."

At the monthly meeting of Tamworth Rural District Council on Saturday it was reported that the Local Government Board had sanctioned the borrowing by the Council of 26,930*l.* and 1,600*l.*, being the Council's share of the estimated cost of the proposed sewage scheme, exclusive of the cost of the site of the joint disposal works and pumping station. The sewage disposal committee was empowered to accept tenders and enter into provisional contracts for the carrying out of part of the scheme at Hockley, Wilnecote, and also for the supply of sanitary pipes, manhole covers, frames, &c., for the whole scheme.

In a consular report just issued on the trade of Nagasaki for the year 1906 Mr. Consul Playfair says:—"I am informed on good authority that the Imperial Steel Works at Wakamatsu (near Shimonoseki) are about to submit to a series of tests before Lloyd's surveyor at Nagasaki the Siemens mild steel made by them, their object in so doing being to have their name added to the list of approved foreign firms who make steel to be used in the construction of ship or boiler material for vessels classed at Lloyd's. This they hope to accomplish by the end of 1907. Their success would seriously affect the export of steel and shipbuilding material from the United Kingdom, while it would also deprive a number of British steamers of much valuable freight."

The report of the proceedings of the Derwent Valley Water Board from March 14 to June 14 states that of the total estimated quantity of stone required for the two dams now in course of construction (1,200,000 tons) 661,082 tons had been obtained from the Bole Hill quarries up to June 13. The number of men employed at the quarries was 365 on June 13 as against 340 on March 14. For the Howden dam,

the report continues, it is expected that 250,000 cubic yds of excavation and 320,000 of masonry will be needed, 239,517 yards of excavation and 142,425 of masonry the figures of the work done to mid-June. The pump had slightly decreased, the daily average for the 13 months ended June 13 being about 687,000 gallons. The number of men employed at Howden on June 13 was the number on March 14 being 302. With regard to the Derwent dam, 262,651 yards of excavation and 147,033 of masonry have been finished of the 320,000 and 360,000 yards respectively, which form the full estimate. The daily average for pumping has been about 666,000 gallons. There were 356 men employed on these works on June 13, instead of the 330 employed on March 14.

### BUILDING AND BUILDERS.

MR. EDWARD YATES, builder, who died on April 26, sixty-eight, left estate of the gross value of 919,412*l.* which the net personalty has been sworn at 748,304*l.*

THE North-Eastern Railway are about to make an extension of the mineral yard at Newport, which is a main line between Thornaby and Middlesbrough, for accommodation of the increasing number of mineral trains. New bridges will have to be built over the Tees, and the cost of the new mineral line and deviation of the passenger line will entail an estimated cost of 70,000*l.*

THE Treasury has appointed a committee to consider the working of the fair wages resolution of the House of Commons of 1891 as embodied in Government contracts, and to report whether any administrative changes are desirable in order to enable the objects of the resolution to be more effectually attained. The members of the committee are:—Sir G. H. Murray, Secretary to the Treasury, President; Mr. H. D. De La Bere, War Office; Mr. A. W. Fox, the Board of Trade; Mr. A. F. King, General Post Office; Mr. F. W. Black, Director of Contracts, Admiralty; Mr. R. Bailey, H.M. Stationery Office; and Mr. Westcott, H.M. Office of Works. Mr. J. J. Wills, of the Labour Department of the Board of Trade, will be secretary.

THE directors of the Perth Infirmary have agreed to go on an extensive scheme of reconstruction, the cost of which will amount to about 20,000*l*. The plans, prepared by Mr. Mackay, architect, were under consideration at the meeting, and it was moved and agreed that they should be submitted to a meeting of subscribers to be held in October next, with the explanation that while the buildings would cost about 15,000*l*, the raising of a sum of 20,000*l* was absolutely necessary to complete the scheme. The alterations are to consist of a new boiler-house and a new home facing New Row. The present entrance to the infirmary is to be altered so as to give a better gradient to the institution. The wards are to be reconstructed and the whole of the interior arrangements of the insti-

REPORT on the trade of the Consular district of Tangier for the year 1906, by Mr. Consul H. E. White, has just been published by the Board of Trade. In the course of it he says: "It is a pity that British Portland cement does not sell in this market. Of the 41,455 cwts. of cement imported here in 1906 practically none came from the United Kingdom, and it was the same in the preceding year, 1905, 106,120 cwts. were imported. Considerable quantities of cement are required in connection with the harbour works in Tangier, and it will be the same at Larache, where similar works are about to be undertaken by the same German firm which has the contract for the Tangier works. Of the cement imported here in 1906, 2,511*l*. worth came from Belgium, 2,228*l*. from Germany, 1,865*l*. from France, and 1,000*l*. from Spain. The quantity imported in 1906 was less than in 1905, as there was a considerable stock over at the end of the year. Bricks and tiles are also important articles of trade at Tangier, in which the United Kingdom does not export any, nearly all coming from France and

the medical officer of health for Worcestershire in his report, in alluding to the water supply of the county, says he regrets that district councils do not possess compulsory powers for obtaining water similar to those possessed by the county council, and that the county council has with regard to acquiring land for sewage disposal powers; for until they can compulsorily obtain water—on equitable terms—many much-needed water

schemes cannot be carried out, and building consequently is delayed, for at the present day people will not attempt it unless they are satisfied that a plentiful supply of wholesome water can be obtained. If such an assurance was forthcoming in the Pershore district he felt convinced that building would go on in the same way that it did in many parts of the Evesham district, where waterworks have been carried out.

In the fourth annual report of the Metropolitan Water Board it is stated that arbitration proceedings and matters arising in relation to the transfer of the undertakings of the metropolitan water companies to the Board were finally closed during the year ending March last. The claims of the water companies, amounting to 50,939,198*l*, were settled for 30,662,323*l*. The expenses of the Court of Arbitration itself amounted to 21,016*l*, after deducting 4,221*l*. returned to the Board by Sir Edward Fry and Sir Hugh Owen. The total expenditure of the Board for legal costs and expenses attendant upon the arbitrations amounted to 254,756*l*. Stamp duty on the vesting of the metropolitan water companies' undertakings amounted to 214,707*l*, being the largest sum ever paid for conveyance duty. Through the various set-offs the net cost of the acquisition of the several undertakings was 31,149,005*l*. cash, exclusive of the debenture stocks and mortgage loans transferred from the companies to the Board under section 2 of the Act, which amounted in all to 11,624,948*l*.

THE annual statement of the cleansing department of Glasgow Corporation states:—Experiments have been made during the year with a number of preparations for the prevention of dust and mud on macadam roads, but in no case was the result such as to warrant their being persevered with. The large increase in the number of rubber-tyred vehicles will eventually compel some alteration in the method of forming the surface of the roads, as it is very doubtful if any of the so-called preventives will be effective on roads formed as they are now, as palliatives have only a passing effect, and the real cure will be found in a mixture of tar, or some other adhesive substance, with the material forming the surface layer of the road, and this will require to be done during the process of formation. The cost for wages, material, &c., for cleansing private streets and courts was 19,020*l*. 1*s*. 6*d*.

**TRESTLE AS SCAFFOLDING.**

JUDGMENT was delivered at the Brighton County Court, in the case of Herbert Schooley, of Islingword Place, Brighton, plasterer, v. John T. Watkins, St. George's Road, Brighton, builder, which was heard last week. This was an application for arbitration under the Workmen's Compensation Act, 1897, and the evidence had shown that Schooley was standing on a trestle when it "kicked" and threw him, and a piece of skin was knocked off his little finger. This subsequently festered, and eventually Schooley had to go to the hospital with a bad arm.

His Honour Judge Scully, according to the *Sussex Daily News*, said the case had been a difficult one, because, in addition to the difficulty on the evidence as to the connection between the injuries and the accident, there were the legal difficulties which the Act presented. As to the injuries, he must accept the opinion of the doctor that the injuries were the result of the trestle accident, and not, as suggested by the defence, the result of a football accident in December last, and he found that the incapacity was due to the trestle accident on April 23, and that the incapacity was at present complete, and arose out of and in course of his employment by the respondent. As to the legal objection raised that Schooley had failed to give the respondent proper notice of his intention to apply under the Act, he (his Honour) found that Schooley did not give notice as soon as practicable after the accident, but the Act provided that the want of such notice did not debar the applicant, if the employer was not prejudiced in his defence by the want of such notice, and he found that the respondent was not prejudiced. He also found that Schooley was not guilty of wilful negligence, although he was, perhaps, a little careless.

As to the question of the height of the building applicant was working on, he held that it was right to measure the height from the lowest level of the ground where the building emerged from the ground as a visible structure, and, as in the present case, to measure, in case of an area below the level of the outside roadway, from the floor of the area. He found, therefore, that the building was more than 30 feet high. As to whether it could be held that Schooley was engaged upon scaffolding, he found that not only was

Schooley working on the trestle, but that the other man, Novis, was using the other trestle and plank in another room, one end of the plank being on the trestle and other on the window ledge. No more perplexing question was raised by this Act than that of what was scaffolding, but after consulting decided cases, and particularly the case of *O'Brien v. Dobie & Son*, he came to the conclusion that a plank supported by two trestles, whose sole object was to provide a standing place to work on, was scaffolding, and that Novis's arrangement of a trestle and plank was scaffolding, and that was enough for the purposes of his decision. If it were necessary to take into consideration whether a single trestle was scaffolding, he would have had some difficulty, as a trestle was not a safe and convenient support, and was not usually used for such a purpose, and he would be disposed to hold that a single trestle so used was not scaffolding. But it was not necessary for him to consider this, having decided that the structure Novis was working upon was scaffolding. He therefore awarded the applicant compensation at the rate of 14s. 5d. per week, being half the amount of his earnings at the time of the accident, as from May 7, with costs on Scale B.

**HOUSING OF NAVVIES.**

MEASURES are at last being taken to provide for the housing of the navvies employed on the Midland Railway extension from Water Orton to Kingsbury. The contractors are making inquiries to ascertain the accommodation available in the neighbouring places of Coleshill, Whitacre and C. Bromwich, but have not yet satisfied themselves that men cannot be housed without special provision. Assurance has been given, however, that whatever special measures may be found necessary will be taken and needful arrangements made within a few days. Meanwhile the contractors are preventing men sleeping in the open works or in the rude shelters contrived by some of the navvies as protection from the rain. A representative of the *Birmingham Daily Post* was informed by the contractor's chief official on the works of an aspect of the question hitherto presented. "Our fear is," he said, "that if we provide huts they will not be used by these men who

is not good for us that men should sleep in the open line. We suffer from petty pilfering, and the men are unable to work well. I have seen men in the trenches unable to lift a shovel and clearly done up for want of food and sufficient food. But, in the first instance, we did not want to send these men off the works or refuse to let them lest they should be driven into Lord Norton's camp. Now we are keeping them outside our boundaries." There are 250 men of all kinds employed on the extension, and the bulk of these are satisfactorily lodged in huts. About fifty have to be provided for, and the contractors say they have already discovered people who would be glad to accommodate the best of the men. It is feared that there has been no difficulty in finding huts for men who are old employes of the firm. The difficulty is in relation to a particular type of man to be met among the navvies. Nomadic and Bohemian in habits, he prefers, like certain apostles of the simple life, to sleep in the open or to bivouac protected from wind and rain only by a few boards and lumps of turf. Many men, having tramped to a job, start work penniless, and the thing begun can only be kept going by daily subvention. The rent of satisfactory huts, it is feared, is as objectionable to these men as the cost of decent food. The contractors have, however, undertaken to do what may seem to be necessary to meet the difficulty. On the wider aspect the question of housing large bodies of men engaged on construction works is felt to be one in which special legislation might be useful. Reginald Farrar has submitted to the medical officer of the Local Government Board a report which ought to attract a great deal of public attention. The report relates to the extraordinary condition of affairs which existed during the large work of construction and navvying. I need not repeat it particularly (writes the London correspondent of the *Manchester Guardian*), because in the present state of the law there was nothing actually illegal in what happened. £20,000 was spent upon the work, and yet, although more than 1,600 navvies were employed, no measures were taken by the contractors for the housing or accommodation of the men. There were not even any shelters to which they could resort in wet weather, and for a considerable time they had to beg their drinking water from farmers

and cottagers or drink that which was pumped up from the neighbouring river for engine use. Some of the workmen built rough shelters of fir boughs and corrugated iron, and nicknamed them respectively "Firwood Avenue" and the "Hotel Cecil." But when one of the local journals published a letter from a magazine calling attention to the inadequate and insanitary nature of these structures, the contractors' manager ordered them to be burned down without taking any action to provide shelter for the evicted. Dr. Farrar acknowledges that when important works are in progress contractors generally provide accommodation for their workmen, but there is at present no legal obligation in the matter, and he was informed that smaller contractors, having tendered at "cutting" prices, are "apt to save in the hutting, and to provide inadequate accommodation or none." He therefore suggests that the Local Government Board should obtain some definite information on the subject of navvy life in general, with a view to consider whether it is desirable to acquire legislative powers in matters of this kind.

#### LABOUR LEGISLATION OF THE AUSTRALASIAN STATES.\*

LABOUR legislation in Australasia has been characterised by attempts to fix a minimum wage by statute, or by arbitration courts and wages boards; and as proposals are being made to adopt the same legislation here, I propose to discuss the circumstances under which the Australasian experiments are carried on and the economic possibilities of their success.

The arbitration courts originated in a desire to prevent strikes and the wages boards in a determination to prevent sweating, but their evolution has been on the same lines. The workmen have used them as a means of distributing national production favourably for the wage-earners. In the working out of this a national policy, known as the "New Protection," has been inaugurated, which, in its completeness, means:—(1) Protection against imports by tariff, (2) a settlement of wages by boards and courts, (3) a

fixing of prices by boards and courts, and, ultimately, (4) the securing to the home producer a first claim upon home-produced raw material, *e.g.* wool and hides. This is the logical and inevitable result of any attempt to solve labour problems by compulsory trade-unionism or by fixing a standard nominal wage by statutory decision.

The chief interest in these experiments lies in the attempt that is being made by them to secure a national standard wage, for the tendency of both courts and boards is to go beyond a minimum—strictly speaking. The New Zealand experiment proves, however, that where there is no agreement—and there can be none—as to what is an absolute standard, machinery created to settle a nominal standard from time to time will simply necessitate constant demands being made for an increase in wages. Such a thing is futile and must break down. A national standard wage is a chimera.

The New Zealand Arbitration Act has been more effective in organising the master than the workmen, and it has therefore raised prices and rents. This I found to be pretty generally admitted, and is borne out by statistics.

The Victorian Wages Boards affect only certain trades, and their influence upon prices is obscure. They seem to have improved the character of the work done. Nominally they only level up to recognised standards, but practically they try to do more, and the workers do not accept that limitation. Their effect upon sweating has been exaggerated, but they have been working under conditions which would yield to them a maximum beneficial result, *e.g.* small number of workpeople affected, a market on the rise, &c. The statistics supplied are not fully satisfactory, and no thoroughly scientific examination has yet been made on the spot regarding the actual effects of the boards. Coghlan's analysis of wages shows their effects to be only very moderate. My own inquiries led me to the conclusion that they could be applied with comparative ease under factory conditions, with some difficulty under home-work conditions and hardly at all under sweating conditions.

Even if we agree with what I can only regard as the altogether overdrawn praise given to Australasian labour legislation by some writers, we must remember, in considering how we can apply it to our own country, the industrial differences between us and these colonies. Par-

ticularly (1) the opportunities which a protective tariff to increase nominal wages without increasing the whole share of the national production; (2) the small indigenous population and the simple industrial constitution of the colonies which permit them to try many experiments before eluding for a long time what is finally to be failure; (3) the fact that the Australasian industrial problem is limited and simplified by the consideration that production is practically exclusively for the home market; (4) the opportunities of apparent success given to such colonies by the greater willingness of the colonial masters to act generously to the worker, *e.g.* courts and boards have been known to award the most extraordinary judgments of nominal wages which no judge or arbitrator would think of awarding here.

### BUILDING LABOURERS IN MONTREAL

An emigrant from the Brighton workhouse who went to Canada gives the following account of his first experience in Montreal:—"I turned up running about to be supplied by the Immigration Office and sought for a bricklayer's labourer, and got one with Messrs. B. J. Rexford, Ltd., contractors, St. James's Street, Montreal. I got 1 dol. 75 cents a day. That is the standing wage for unskilled labour all over Montreal and Canada generally. There are now about 300 on the job. We are erecting a 'sky-scraper' factory in St. Antoine; 300 hands there are not five English. They are all except a few niggers, four Scotch stonemasons, and four English bricklayers. All the rest are carpenters, Italian bricklayers, mortar-makers and carpenters and ironworkers' labourers. Oh, such a French, Canadian, &c. I have working with me one Canadian, two Italians, two niggers, and I am serving and cement to the Scotch and English masons and layers respectively. We start at 6.30 A.M. and leave at 5.30 P.M., with only thirty minutes for dinner, so that we work for 10½ hours right off the reel with only 15 minutes off. It's a pity I do not understand bricklaying. Bricklayers get 50 cents, or 2s. 1d., per hour, making 10s. 0d. per nine-hour day; stonemasons 40 cents, or 1s. 8d.

or 15s. per nine-hour day; carpenters 30 cents, or 3d. per hour, or 11s. 3d. per day. I don't know what the workers get, i.e. the men who fix the iron pillars and ers. I earned last week for five days 9 dols. 60 cents, 8s. 6d., as I put in some overtime, but lost a day through being all day Friday. The firm keeps back two days' work with the new hands until they hold a week in hand."

### COST OF PATENTS.

The course of a printed reply to a question by Mr. G. N. Jones, M.P., secretary to the Amalgamated Society of Engineers, Mr. Lloyd-George says he is aware that of late the Patent Office fees have yielded a considerable sum, but at the present time, whilst the office expenses are rapidly increasing and new duties are being thrown on the office by the Patents and Designs Bill, he can give no undertaking to reduce them. He does not believe that it would be to the interest of poor inventors to substitute for the present fees those chargeable in the United States, which would benefit the comparatively small number of successful inventors at the expense of the much larger number of unsuccessful inventors, who can less afford to pay. Mr. Lloyd-George gives a tabulated statement showing the comparative cost of patents in the two countries. In the United States the preliminary and allowance fees amount to 7%, and the patent remains in force without further fee for seventeen years, while in the United Kingdom the fees amount to 5% to the end of the fourth year, at the expiration of which period a sum of 5% must be paid for renewal, and further renewal fees increasing by 1% annually to 14% at the end of the thirteenth year. Of British patents over 65 per cent. are allowed to expire at the end of the fourth year, presumably because the patented invention has not proved a success. On those therefore whose fees paid amount to 5% only, as compared with 7% in the United States. In regard to the additional 5% charged in the United Kingdom for patents renewed at the end of four years, it may safely be assumed that only such patents are renewed as have met with some measure of success, in which case the fee is a comparatively unimportant matter

to the patentee. Only 4 per cent. of the British patents remain in force for the full term of fourteen years.

### DUST PREVENTION TESTS.

THE judges' committee appointed by the Roads Improvement Association (Incorporated) to carry out the competitions for the best tar-spreading machine and the best preparation of tar for road purposes have made their awards as follows:—

Competition for the best tar-spreading machine:—First prize of 100 guineas and the Association's gold medal to Thomas Aitken, County Buildings, Cupar Fife, for "Aitken's patent pneumatic tar-spreaders"; second prize of 50 guineas and the Association's silver medal to Tarspra, Ltd., 20 Victoria Street, London, S.W., for their "700-gallon tarspra (patent) Thornycroft motor-van."

Competition for the best preparation of tar for road purposes:—First prize of the Ballymenagh Woollen Factory Company's 100-guinea trophy and the Association's gold medal to R. S. Clare & Co., Ltd., Stanhope Street, Liverpool, for "Clare's patent tar compo."

These tests were carried out on May 22, 23, 24 and 27 last on certain roads in Middlesex and Berkshire. Since these dates the roads have been kept under constant observation, and durability being an important consideration, it has not been possible to make the awards until the present time.

A full report of the trials is now in course of preparation. It is proposed to divide it into two sections—one, the judges' report on the respective merits of the various machines and preparations of tar entered for the competitions, and the other a full and comprehensive survey of the whole question of the use of tar for road purposes.

The cost of these trials was borne by the Royal Automobile Club and the Motor Union of Great Britain and Ireland. The judges' committee, in addition to members of the Council of the Roads Improvement Association and others, included eight leading engineers and road surveyors, appointed after consultation with the Incorporated Society of Municipal and County Engineers and the County Surveyors' Society.

**DUST-PROOF ROADS.**

THE Local Government Board has communicated to the Lindfield (Sussex) Parish Council a decision upon tarring roads to lessen the dust nuisance caused mainly by motor traffic, which is certain to cause consternation throughout East Sussex. A short time since the East Sussex County Council notified the rural districts of its preparedness to tar-spray roads if the local councils would guarantee half the cost. Many councils accepted the offer, Lindfield being among the number. A long length of road was tarred, the half-cost being 25%. The Local Government Board has now written to say that it cannot see its way to sanction the half-cost being made a special charge upon the parish. If this decision is adhered to, the individual members of the Council will have to refund the money.

The decision of the Local Government Board is of considerable interest to Northamptonshire, and particularly to Towcester, where a point has arisen similar to that decided at Lindfield.

Rural district councils are empowered to delegate certain of their powers to parish councils, and the Towcester Rural District Council has adopted this course—a course which enables the cost of watering the roads of Towcester to be charged upon that parish. The introduction of the motor-car and the rapid development of traffic which followed early forced the Towcester parochial authorities to the conclusion that some more effective method than watering for dealing with the dust nuisance was necessary, for Towcester, on the main road between London and Coventry, felt the full force of the motor. The Towcester Council therefore applied to the Northamptonshire County Council to make a contribution towards the spraying of the main road with tar. The County Council agreed to pay one-third of the cost, at the same time intimating that the payment must be considered an allowance in lieu of watering as in urban districts. The remaining two-thirds became a separate charge on the parish of Towcester; but while the Towcester Sanitary Committee, which is practically the Towcester Parish Council, was perfectly willing to make a payment towards the cost of the tarring, the district auditor declined to sanction it on the ground that the Public Health Act of 1875 said nothing about road-making.

Following this the point was raised whether the might be considered as road maintenance, and the P. Council of Towcester unanimously requested the Towcester Rural District Council to allocate two-thirds of the cost to the parish of Towcester.

At the last meeting of the Northamptonshire County Council held six weeks ago, application was made by Towcester, through the roads committee, for an increased rate from the Council and for an order charging the remainder of the parish of Towcester. The Council was advised that neither the Towcester Parish Council nor the Rural District Council was a highway authority within the meaning of the Act with regard to main roads, and neither body could legally enter into an agreement to pay the extra cost consequent on the tarring. Ultimately the matter was referred to counsel in order that counsel's opinion might be taken.

**NEW CATALOGUES.**

WE have from time to time noticed the patent wire-mesh manufactured by Messrs. Pilkington Bros., Ltd., and which is of great importance in preventing the spread of fire. They have issued a new catalogue of their glass tiles and slates for roofing purposes. These can be intermingled with ordinary tiles, and great care has therefore been taken in faithfully representing the contours of glass panels, corrugated glass tiles, Roman glass tiles (single and double), and Broseley glass tiles. There are also flat glass slates, which correspond with the following sizes:—Duchess, small duchess, countess, viscountess, large ladies, doubles. We need not say how many occasions present themselves in practice for the entire or partial use of such a roof covering. The glass tiles can be obtained of various textures, and form most valuable additions to building materials.

At a meeting of the Portsmouth electric-light committee several tenders were accepted. That of Messrs. Acton & Co. amounting to 3,004*l.*, was accepted for steam, exhaust water-pipes, &c.; that of the British Thomson-Houston Company, amounting to 850*l.* 8*s.*, for the high-tension switchboard, and that of the British Electrical Transfers Company for six transformers at 66*l.* each.

WALES.—Sept. 7.—For erection of a police-station at Whitchurch, near Cardiff. The Glamorgan County Council Offices, Westgate Street, Cardiff.

THE Board of Education have drawn the attention of the Sheffield education committee to the apparent need of providing additional accommodation in the district of Hillsborough and Malin Bridge. The matter was referred to the building sub-committee, who are recommending that an infant department, for the accommodation of 400 children, be erected on the unappropriated portion of the Malin Bridge school site, and that Messrs. Potter & Sandford be instructed to prepare plans.

**TRADE NOTES.**

We have received from the Carron Company their new list of Gas-heated Steam Radiators. The blocks are well reproduced and sizes and prices are plainly given. The Carron Company will be pleased to forward a copy to any architect, builder, or contractor on application.

MESSRS. LIPTON, LTD, have placed a contract with Messrs. Farnham, Ltd., of Caxton House, Westminster, to treat the whole of the extensive frontage of their City Road premises by the Farnham patent sand-blast process, which will restore the stone and brickwork to their original tone. The process being entirely a dry one, this result is accomplished without the slightest injury to the fabric.

The Bexhill patent casement window was lately described in connection with the Building Exhibition. We have now to announce that Messrs. Campbell, Smith & Co., Ltd., have secured the sole license for its sale and manufacture. They will be pleased to send the full specifications and details of joinery on receipt of order for the fittings, and quote for the complete window if desired. Any further information will be sent by post following receipt of inquiries. Working models can be seen at their premises, 25 Newman Street, W.

# "Standard"

"Standard" Porcelain Enamel Ware is moderate in cost, beautiful in its finish and extremely durable. Absolute freedom from cracks or crevices assures the maximum sanitary protection. A bathroom fitted with "Standard" Ware greatly increases property value.

Write for our elaborate booklet, "MODERN BATHROOMS," also for our special lavatory booklet, showing many new patterns. Ask for Booklet No. 6, post free on application to Dept. F.

# ELECTRIC NOTES.

At a meeting of the Dundee tramway committee last week contracts were allocated for the tramway extension to Downfield. For the construction of the roadway the tender of Mr. David Horsburgh, Dundee, was accepted; for tie bars, that of Messrs. Bayliss, Jones & Bayliss; that for rails, of Messrs. MacLellan & Co., Glasgow; and for points and crossings, that of the Hadfield Company, Ltd. For the overhead and electrical equipment, the contracts were allocated as follows:—The Forest City Electrical Company; the British Insulated and Helsby Company, Ltd.; the Alloa Iron Company; and the British Insulated Cables Company.

At West Hartlepool on the 19th inst. the General Electric Tramway Company, Ltd., were summoned for causing an annoyance by using four cars that clattered. Mr. Matthew Harrison, who defended, asked the town clerk to agree to an adjournment to enable the company to put the cars right. The town clerk consented, but intimated that even though the cars were put right, he must, if the Corporation thought it, come there at the end of that period. He suggested that the cars should be taken off the line altogether, and that the whole stock should be lubricated twice daily, instead of once.

A LOCAL GOVERNMENT BOARD inquiry was held at Coventry on the 15th inst. by Mr. H. S. Bidwell into an application of the Corporation to borrow a further sum of 7,000*l.* for the purposes of their electricity undertaking. It was stated the amount formed part of a larger scheme, the present plant being insufficient to meet the demands for electric energy. It transpired, too, that in one month last winter the department had applications for about 3,000 horse-power motors. There was no opposition to the application.

The control of the Puebla Tramway Light and Power Company has been acquired by a London syndicate headed by Sir Weetman Pearson, of S. Pearson & Son. The transaction involves the consolidation of the interests of the Anglo-American Electric Company with those of the Puebla Tramway Light and Power Company, all the properties of the former company, including its developed water-power plant near the city of Puebla, having been conveyed to the

latter company. Sir Weetman Pearson has been elected president, and Dr. F. S. Pearson will remain on the board of directors for some time.

# VARIETIES.

An agitation has been started in East Anglia to remove growing ivy from churches, on the ground that it not only hides much beautiful architecture, but endangers the stability of the structure.

THE Solihull District Council have accepted an offer from Mr. J. Silcock to give expert advice upon the proposed Shirley sewage scheme, the estimated cost of which is 38,000*l.*, at a fee of 100 guineas and travelling expenses.

A START will soon be made with the erection of the buildings for next year's International Exhibition in Edinburgh, but there will be deviations from the original plans. The chief alteration affects the concert hall, which is to be removed from the other buildings, and thus avoid any noisy interruption of the music. It was intended originally to erect the concert hall immediately in front of the centre of the main industrial-hall building. The plan now shows the buildings in the form of a quadrangle.

A DEPARTURE from the usual procedure was taken last week by the Oldham Medical Officer of Health, who summoned the firemen at Gallway Mill, as well as the firm of James Greaves, Ltd., who own it. The offence was the emission of black smoke, and the firemen were charged with using the mill's furnace when it was not in a condition to consume the smoke. Against Thomas Walsh, an assistant fireman, it was alleged that at the time the observations were taken he was under the influence of drink. Each of the firemen were fined 10*s.* and costs and the firm was fined 3*l.* and costs.

THE great chimney-stack at Par, St. Austell, Cornwall, was on the 23rd inst. "thrown" by Mr. William Larkins, the Bow steeplejack. The chimney was 275 feet high and was composed of a million bricks. It is calculated that the structure weighed 3,000 tons, and it stood on a granite foundation. The stack had been in use forty-four years, but had been disused for the past twenty-five years. It was originally constructed for smelting silver lead. Mr. Larkins

thinned the base of the walls to the extent of a brick and a half, and then cut half-way round to the depth of 3 feet. The stack adjoined the main road. The work had been abandoned by a London firm which commenced operations by taking off 60 feet of bricks from the top of the stack.

THE British Consul for Mexico in his report on trade during last year states:—"Contractors for the erection of factories should find Mexico a fair field for profitable action; the policy of the country is to manufacture in Mexico itself as much as possible that Mexicans require. There is a considerable amount of industrial development quietly going on." Most of the plumbers or "sanitary engineers" in Mexico are British, but on their subscribing to certain conditions many have joined the Plumbers' Federation of the United States. Among these conditions is one which binds them to purchase only in the United States. The result is that while Mexico is an ample field for that class of goods, British made sanitary appliances are very seldom seen.

PREPARATIONS are being rapidly pushed forward for the huge Machinery and Engineering Exhibition at Olympia, which throws open its doors on September 19 next. The ironwork which frames the glass sides of the huge building has been repainted, and in order to avoid the necessity of building scaffolding, the management engaged a number of seafaring men who have carried out the dangerous work with rapidity, despite the fact that their foothold was of the flimsiest character. It is expected that the cleaning and repainting of the interior will be completed within a week, by which time several tons of paint will have been consumed.

At an inquest held in London on the 23rd inst. regarding the death of a plasterer who was killed by falling from a scaffolding, it was proved that no guard was provided for the workmen engaged thereon, although on the morning of the accident attention had been called to the omission. A Home Office inspector said that if he had seen the scaffold before the accident he certainly should have advised the use of a guard-pole. This accident was only one of dozens that happened, and which would be obviated by the compulsory use of guard-poles. The jury returned a verdict of "Accidental death," and added as a rider that in their opinion a guard-pole should have been used, and that they approved of legislation making the use of such precautions compulsory.

THE Bromsgrove Board of Guardians on Tuesday considered a letter received from the Bodmin Board in reference to the Workmen's Compensation Act. The letter pointed out that the action of the insurance companies in refusing to accept premiums in the case of elderly and other workmen would inevitably lead to a greater number of unemployed and a consequent increase in the cost of outdoor relief. They recommended that Boards of Guardians should urge an amendment of the Act, whereby by contracting out or otherwise the difficulties which had arisen in some cases should be obviated, and asked the Board to adopt a resolution on the subject. A resolution to this effect was adopted.

### CO-OPERATIVE HOUSING AT THE CRYSTAL PALACE.

FOR nineteen years co-operators have held an annual festival at the Crystal Palace, and that which closed on Tuesday last was one of the most successful yet organised. The proceedings commenced on the 21st inst. with the opening of a great exhibition in the north nave, with a section specially devoted to housing, and as the movement developed it is becoming increasingly clear that, in addition to the usual advantages of co-operation in encouraging thrift and business capacity, it has two special advantages which react on each other, viz. the encouragement of social life and recognition of social duties, on the one hand, and the facilities it offers for site-planning on the other; that is to say, the planning in detail of a given site, usually of some acres, providing for the different types of houses to be built on it, the gardens allotted to them, and any common land which may be required for recreation or other purposes for it is obvious that a society which obtains its land by the acre and aims at the greatest advantage of its tenants, will be both better able and more willing than the ordinary builder to devote part of this land to their common purposes, and to commission an expert to plan out the whole to the best advantage.

In this connection special reference may be made to the Tenant Co-operators, Ltd., the Ealing Tenants, Ltd., the Sevenoaks Tenants, Ltd., the Hampstead Tenants, Ltd., and the Garden City Tenants, Ltd. These societies were for the

part well represented at the exhibition, and there is  
n to believe that they are meeting a fresh want in con-  
on with the housing problem.

the Hampstead Tenants, Ltd., had on view a large  
red plan of the proposed Garden City at Hampstead;  
the Sevenoaks Tenants, Ltd., showed some capital  
of cottages, as well as a very fine model.

prominent position was occupied by the General  
ers, Ltd. (Co-operative Society), who showed some  
class artistic joinery, including some serviceable  
ers made for the living-rooms in Garden City houses.  
aturday last was the great day, when many thousands  
operators from London and the provinces assembled,  
the attractive programme was carried out in a very  
actory manner; nor should mention be omitted of the  
fruit, flower and vegetable show, or the concluding  
ay of fireworks, for which the Crystal Palace is famous.

## LARGE SALE OF WELSH LAND.

FTER the present boom in the manufacturing trades in  
ountry has subsided, as it may be expected to do when  
eneral cyclic movement which is admitted to govern  
matters has performed its task, investors will look  
for other channels in which to successfully employ  
capital. Some sign of this approaching change of  
ions is heralded by the recovery on the Stock  
nge only during the last few days, and we shall  
bly soon have the company promoter's advertisements  
ling the newspapers with invitations to the unwary.  
new opening one of the best securities should be the  
n and close on to our rising towns, and when a buyer  
dgment and discretion there is little doubt that large

ultimate profits are obtainable in this direction. In and  
about London itself expert knowledge is essential  
before investing in land, and it is very difficult to obtain  
really reliable advice on the subject. Successful  
adventures generally fall to the lot of those who  
have the best understanding of the local signs of  
growth, and in this manner many large fortunes  
have been made in quite recent years. The sale of the  
Middleton Evans estates at Llandrindod Wells next Tuesday,  
by Messrs. Knight, Frank & Rutley, is likely to show how  
far in this way outside investors are likely to compete with  
local capitalists, because the development of the Welsh  
Highland Spa has in a sense up to the present been retarded  
by these lands having been unavailable for building, and  
now that they are at last on the market great interest has  
been aroused on all sides. The growth of Llandrindod has  
been exceptional in recent years, the motor-car and in-  
creased railway facilities having largely contributed thereto.  
A greatly accelerated development is now certain to take  
place, and investors familiar with the subject agree that the  
increase of population and rating values in other towns,  
having the attraction of mineral springs for the use of  
visitors, is a fair indication that such districts must always  
yield satisfactory profits to buyers of land who are lucky  
enough to "cut in" at the right moment. The great in-  
crease in population and rateable value of inland watering-  
places, such as Buxton, Cheltenham, Harrogate and Tun-  
bridge Wells, affords strong evidence in this respect, whilst  
the recent developments in seaside towns, such as Newquay,  
Cromer, Bexhill and Hove, have shown hugely increased  
value, in some cases land bought in recent years at agri-  
cultural value having advanced to 2,500% per acre.

THE London and North-Western Railway Co. have  
provided three new corridor saloon trains for the special  
service run between Euston and Liverpool in connection  
with American traffic. Each train consists of three ordi-  
nary saloons, two dining saloons, one kitchen-car and two  
brake-vans, and will accommodate in the ordinary saloons  
100 passengers—52 first-class, 24 second and 24 third-class.  
The dining-cars will accommodate 102 passengers—51 first-  
class, 24 second and 27 third. Access to the train is by  
wide vestibules at the ends of each of the coaches.

**KENTISH ROADS.**

THE report of Mr. H. P. Maybury, county surveyor for Kent, states that the maintenance and repair of the rural main roads within the urban districts of Bexley, Chislehurst, Cheriton, Footscray, Wrotham, Whitstable and Dover have cost during the past year 76,291*l.* 10*s.* 2*d.* In many of the Home Counties costs have gone up from 50 per cent. to 60 per cent. in three years, and are still increasing, and at least 10,000*l.* per annum of the expenditure in Kent is now due to motor-car traffic.

As in the year preceding, 107 traction-engines were licensed for use in the county, and, in addition, day permits have been issued and engines licensed for agricultural purposes to the number of 137. This traffic is most damaging to the roads, whilst the fees accruing therefrom are ridiculously small. Upon payment of half a crown an engine may traverse the whole county, doing damage to the extent of hundreds of pounds. For 120 such occasions during the year under review the gross receipts were 15*l.* Thus, for the benefit of a comparatively few people owning these appliances, the whole of the ratepayers of the county have to find large sums of money year after year to make good the damage caused.

Up to March 31 last 3,099 motor-cars had been registered in the county, being an increase of 643 in the account year. Of this number 71 are registered as heavy motors, under the "Heavy Motor Car Order, 1904." In the county of London some 25,000 motors are registered, and the fees, together with Exchequer contributions, go into the coffers of the London County Council, whilst the ratepayers, particularly those in the Home Counties, maintain the roads upon which these vehicles are largely used. Prior to the passing of the Local Government Act of 1888 half the cost of main road maintenance was provided out of Imperial funds. Since that time the cost of upkeep has almost doubled, whilst the Exchequer contribution has not materially increased. The demand is for better and dustless roads, and, with additional Imperial aid, this can be accomplished. Local material, which was sufficient for repairs in pre-motor days, is no longer suitable, granite—with no greater covering area per ton—having to be procured at double the cost. Again, the Legislature has put upon us the provision and erection of motor-car signals

without providing us with a grant in aid of cost of such work. During the account year we purchased 99,500 gallons of oil, which was used in treating the main roads through populous places, all such work being an entirely new charge upon the county department. Some 53 miles of surface directly maintained by your Council was tar-painted at a cost of upwards of 4,000*l.* in addition to which contributions have been made for similar work undertaken in urban districts, where the councils are the retaining authorities. It may be that this tar-painting work is a preservative to the road, and the surveyor hopes they may derive some benefit from it. As a dust-laying material properly applied is most effective, and will be so used in future. The residents in rural districts suffer more from the dust nuisance than do those in urban areas, because much greater speed is attained by motors in the former, whilst in the latter street watering is almost general. The high speed traffic has a prejudicial effect upon the road surfaces, and as at least 60 per cent. of the cars are fitted with armoured tyres much greater damage is caused than formerly. The steel studs and bands minimise the risks of side-slip, of punctures and wear of tyres, but of course the expense of the roads. Extra strength and extra material are required in the material used for repairs, and this must be of the best possible quality. The motorist should be required to pay the cost of this extra expenditure by an increased license charge, the monies to be derived therefrom to be applied to road improvement and dust laying, and it is hoped that, having regard to possible early legislation hereon, the Council will see that a good case is presented from the ratepayers' point of view. The incident of the charge upon all commercial mechanical traction should at the same time receive consideration, and should be met with in any Government measure to be introduced.

**IRON ORE SUPPLIES.**

A PAPER was read by Mr. Bennett H. Brough, Assoc. R. F.G.S., F.I.C., before the British Association, in which he said:—

Of all the problems with which the practical geologist has to deal, none is of greater importance at the present time than the discovery of fresh sources of iron ore supply. Every inhabitant of the United Kingdom, of the United

es and of Germany requires annually about a quarter of on of the iron, of which the world last year produced 00,000 tons, the result of the smelting of over 120,000,000 of ore. Year by year the production and consumption are easing, and many of the deposits of the richer ores are giving signs of depletion. The question of ascertaining the demand for the vast supplies of iron ore that will be future be needed will be met calls therefore for very serious consideration, and a few statistical notes may be ul as a contribution to a discussion of the subject.

During the past half-century the development of the iron stry has been remarkable. In 1854 Mr. J. K. Blackwell ved that the world's production of pig-iron did not ed 6,000,000 tons, of which the United Kingdom produced er cent, France and the United States each 12½ per , and Germany 6.6 per cent. In 1905 the world's pro- ion had attained the enormous total of 56,000,000 tons, hich the United States produced 42.7 per cent., any and Luxemburg 20 per cent, the United Kingdom per cent., and France 5.5 per cent.

n Great Britain the principal iron-ore producing districts Cleveland, in North Yorkshire, which in 1905 yielded er cent. of the total output of the kingdom; Lincoln- (14.8 per cent.), Northamptonshire (13.9 per cent.) and estershire (4.7 per cent.), together yielding 33.4 per cent. e total output; Cumberland (8.6 per cent.) and North ashire (2.7 per cent.), Staffordshire (6.1 per cent.) and land (5.7 per cent.). The Cleveland iron ore occurs in foot bed in the Middle Lias, and contains about 30 per of iron. It is worked by underground mining. In olnshire, Northamptonshire and Leicestershire the n iron-ore beds form part of the Inferior Oolite, contain about 33 per cent. of iron, the works being ly open-cast. In Cumberland and North Lan- ire the red hæmatite occurs in irregular masses in oniferous limestone. It contains more than 50 per of iron, and is worked by underground mining. The stone in Staffordshire and in Scotland is mostly obtained mines that also produce coal.

uch, in brief, are the home deposits from which the sh supply of 14,590,703 tons of iron ore, valued at ,184/, was obtained in 1905. Even that enormous ut did not meet the consumption, and 7,344,786 tons

were imported. Of that amount 78.5 per cent. was brought from Spain, 5.4 per cent. from Norway, 4.2 per cent. from Greece, 4.0 per cent. from Algeria, 2.6 per cent. from France, 2.6 per cent. from Sweden, 1.5 per cent. from Russia and smaller quantities from Turkey, Germany, islands in the Pacific, Belgium, Newfoundland, India, Australia, Italy (Elba), Persia, Portugal and other countries. In fact, the world is being ransacked for fresh iron-ore fields to supply ores for the British blast furnaces. The port at which most of the ore was delivered was Middlesbrough (1,789,639 tons), then followed Glasgow with 1,042,179 tons, and then Cardiff with 875,462 tons.

While it is probable that the British iron-ore fields will be exhausted in a century or two, the outlook in other countries is similar. This is borne out by data relative to the available iron ore supplies of the world which have been collected by Torneböhm for the Swedish Parliament, and, although largely conjectural, these figures are of great interest.

The outlook for the British industry is not altogether a depressing one, for whilst the rich ores of Bilbao and Elba are becoming scarce there are still vast quantities of ore available in the North of Scandinavia, in the South of Spain, in Algeria, Canada, Cuba, Brazil, Venezuela, Chili, India, China (notably in the Shansi district), Australia and South Africa. The high cost of carriage is, of course, an important factor; but the great economies which have and will be effected in transport will reduce this item. The future of the home demand is likely to be affected by the development of the basic open-hearth process of steel-making which enables phosphoric ores to be utilised. In the course of time such phosphoric ores will doubtless occupy a very prominent place in the manufacture of high-class steel. The development of magnetic concentration and of the briquetting of pulverulent ores for furnace use will render possible greater utilisation of poorer ores, while the development of the electric furnace will doubtless render it possible to utilise black sands and other titaniferous iron ores which, although met with in abundance, cannot at present be treated profitably in the blast-furnace. There need therefore be no immediate anxiety regarding the supply of the more impure iron ores, the application of which cannot fail rapidly to increase.

## Patent Independent Trentham Boiler

**NO BRICKWORK REQUIRED.**

All Flues internal and entirely surrounded by water.

Heating Power, 1,000 to 10,000 feet of 4-inch Pipes.

## DISINFECTION OF SCHOOLS.\*

THAT there is urgent need for the daily disinfection of schools must be admitted by all intelligent observers who are acquainted with the histories of the infectious diseases common to school children. It is universally conceded that preventive medicine is the most important form of medical science, and must inevitably become the medicine of the future. The application of sanitary science to problems of disease has already borne rich fruit. Typhus fever has practically disappeared from these realms. Smallpox, under efficient vaccination rapidly disappears from all countries. Malaria is going, and now that the bacterial cause of Malta fever has been located it will no doubt rapidly decrease. The group of infectious diseases incident to childhood, however, has not fallen at a rate commensurate with the great advances of sanitation. This group consists of diphtheria, scarlet fever, measles and whooping-cough. Tuberculosis in school children still stands at a level much too high. All pathologists are agreed that each of these diseases is caused by a specific germ. The diphtheria bacillus and the tubercle bacillus have been isolated, studied and definitely referred to their respective diseases. Although the germs of scarlet fever, measles and whooping-cough have not yet been isolated, it is universally held that the analogies between the various stages of these maladies and the corresponding stages of those infections in which the micro-organism has been identified are so complete, that the conclusion that they are produced by germs is inevitable. If this be so, it will be admitted on all hands that the one intelligent method of preventing these diseases is the timely destruction of the causal agent.

Evidence is accumulating to show that schools play an important part in the spread of infection. The medical officer of health for the Hitchin urban district stated in a recent report that the evidence is almost conclusive that schools are the chief agents in the dissemination of infectious diseases. Dr. B. K. Goldsmith, assistant medical officer of health for Manchester, in a report on the influence of school life on the spread of scarlet fever, says:—

\* A paper by J. T. Ainslie Walker, F.C.S., read at the International Congress on School Hygiene.

"We cannot fail to be struck with the sudden rise in number of cases when the schools reopen after the summer and Christmas holidays." In the same report this observer further states that:—"We know that other diseases, ophthalmia, ringworm and scabies are frequently contracted at school. It is of course essential that the work of educating the children of the nation should continue, but it is no less essential that they should be protected as far as possible." The medical officer of Chorley is of opinion that:—"The principal method of propagating infection through the attendance of children at school while in first stage of the disease. Measles is decidedly infectious before the rash appears and when the symptoms differ little from those of an ordinary cold. The practice adopted by the Council of giving prizes for regular attendance at school, and not allowing for absences due to sickness, undoubtedly resulted in children being sent to school who unfit themselves or coming from houses in which there was a case of infectious disease."

It must be clear to all unbiassed minds that in the cases in which the specific germ is known, such as diphtheria, tuberculosis, &c., the destruction of this germ wherever it is found, should be the primary object of every preventive measure; and further, that in cases in which the specific germ has not yet been isolated but in which various pus cocci appear as the causes of purulent affections of throat, nose and ear in sequelae of measles, scarlet fever, &c., that the destruction of these germs should be as carefully secured.

Now it is amply proven that the floors of schoolrooms are covered with dust containing pus cocci, tubercle bacilli and at times diphtheria bacilli. The dry sweeping of floors is useless in that dust is by this process merely whirled into the air to alight later on the floor and on the furniture. When we remember that the inhalation of dust is the most potent factor in the production of pulmonary tuberculosis, the necessity of spraying floors with a liquid disinfectant before sweeping, and of rubbing all furniture, wall surfaces, &c., with a wet cloth wrung out of an efficient disinfectant will be evident. In the course of his presidential address at the opening of the Medical Congress at Exeter, Dr. Henry Davey added the weight of authoritative endorsement to this argument. Dealing with the question

the enormous mortality from consumption, the President declared that "the only way to actually prevent the disease is by a perfect system of school hygiene, physical and mental, and by a careful system of disinfection and sanitation." Dr. Davey's pronouncement is, of course, equally applicable to diphtheria, and most probably to scarlet fever, measles and other diseases which lend themselves with peculiar readiness to dissemination through school intercourse. The infection of whooping-cough is conveyed by the pluttering of infected mucus during the paroxysm of the infected child's throat into the faces of other children or the atmosphere surrounding them. Disinfection of the floors and furniture in the manner described and the atmosphere and walls by a spray are obviously methods where this disease has appeared at school. Apart from the immediate benefit secured by thorough disinfection of schools in the matter of the prevention of infectious disease, the educational value of a routine system of spraying and disinfection to the children who should participate in it would be very considerable. Managers of schools, teachers and the children themselves should all be taught the principles of disinfection if the tide of infectious disease is to be materially stemmed. Bacteria which produce disease are found in the hair, on the skin, in the clothing of children, in the dust and atmosphere of the schoolroom; they are invisible—nevertheless they pass directly or indirectly from child to child. A school boy should be led intelligently to understand all the nature of disinfection and the imperative need of thorough disinfection, which latter he should witness practically carried out in his classroom. Such methods of education can produce that lasting influence on the boy's mind that will secure intelligent disinfection of his home in after life.

The need of school disinfection has already been recognised abroad and in certain quarters at home. In Queensland recently a deputation to the Secretary for Education drew attention to the positive danger of the conveyance of infection not only by tuberculosis, but other diseases of manufacture—such as scarlet fever and diphtheria—the use of slates imperfectly cleaned and disinfected. It was pointed out that it was the common custom for children to clean their slates by spitting on them, and as the

mouth frequently harboured pathogenic organisms, especially the bacillus of diphtheria, there was a real danger of the direct spread of this disease from a case so mild as probably not to be recognised except on special bacteriological examination. Inasmuch as it was considered almost impossible to prevent such carriage of infection, it was suggested that such slates should be washed each day after use in a solution of a disinfectant. In America the practice of disinfecting the floors of schoolrooms has become part of the daily routine. In this connection the committee on disinfection of the American Public Health Association, in reviewing the work of the year 1904, state that remarkable results have followed the use of disinfectants when sprayed daily on the floors of schoolrooms—infectious colds and other dust-borne diseases being considerably lessened among the scholars.

Dr. Leslie Mackenzie, writing on the subject of school-cleansing, states:—"As the cleansing of a school should be periodic and systematic, it is well to know of a single method that will at once cleanse and disinfect. Formerly, when infectious disease broke out in a school, a pound or two of sulphur was burnt in a basin standing in water, the windows, chimneys and other crevices having been first stuffed up. The place remained closed for a day or two, and was then supposed to be disinfected. This primitive method is still followed in many places, and probably it still satisfies many people. I prefer the simpler, quicker and more effective method of spraying the walls, floors, desks and furnishings with a spray-pump. This is the quickest method of allaying the dust; it can in a few minutes saturate floor, desk, dado, &c., with a disinfectant of any strength, and I know of no better preliminary to effective cleansing. When a serious outbreak of disease occurs the spraying must proceed to profuse wetting of all dust-covered surfaces."

The Moseley medical officer of health not only recognises the danger of infection in schools but has demonstrated the efficacy of the disinfection of floors as a preventive measure. In a recent report referring to the absence of any single case of infectious disease, he says:—"It is several years since a similar state of things prevailed, and the fact is attributed to the new system of disinfecting the schools from top to bottom every week with Cyllin spray."

THURSDAY, SEPTEMBER 5.

TWO GREAT EVENTS, 1837-1907.

1837

Was the year in which the late Queen Victoria commenced her  
**GLORIOUS REIGN.**

To commemorate the 70th Anniversary of this happy event, we have in

1907

Commenced to lay out a Building Estate in the glorious Island of Mersea, and named it

**THE QUEEN'S ESTATE,  
WEST MERSEA, ESSEX.**

THE Estate is situated in the best portion of the Island, and is well wooded, and enjoys a good frontage to the sea and main roads. The Island is at the confluence of the Rivers Colne and Blackwater, and enjoys the reputation of being the healthiest portion of the East Coast. It has a south-westerly aspect, and enjoys a maximum amount of sunshine. Admirably situated for yachting, boating, shooting, fishing, and other sport. It is 40 miles by road from London, 18 miles from Clacton, and 8 miles from Colchester, and affords a splendid rendezvous for motorists, cyclists, and others. There is an excellent service of G.E.R. motor buses from Colchester North Station, and also a service of motors and horse conveyances from Colchester High Street. The Island has been aptly described as

"THE RIVIERA OF ESSEX."

Instructions have been given by the Proprietors to  
**MR. J. H. GARDNER**

To OFFER for PUBLIC SALE, on Thursday next, September 5, 1907, in a Marquee upon the Estate, The First Portion of the Queen's Estate.

**200 FREEHOLD PLOTS**, about 150 of which have frontages to the Sea, to Empress Avenue, and the remainder have important frontages to the main road.

This is an unique opportunity for the securing of sites suitable for the erection of bungalows, houses, shops, hotels, &c. Mersea Island is fully described in "The Building Trade," April 24, 1907.

Arrangements will be made for the conveyance of intending purchasers by motor and rail from London, Clacton, Colchester, and other places; also by ferry from Brightlingsea to East Mersea, thence by motor to Queen's Estate. Luncheon will be served in the Marquee before Sale.

Luncheon at 2.30 p.m. Sale commences at 3.30 p.m.

Free Conveyances.

Plans and Particulars will be ready after the 24th August, and may be obtained from the Vendors' Solicitors, Messrs. Elwes, Turner and Hawkins, 3 High Street, Colchester; Mr. J. J. Edwards, The Queen's Mersea Estate Offices, 90-91 Queen Street, Queen Victoria Street, London, E.C.; the Mersea Brick and Iron Company, Ltd., Sea View Road, West Mersea, Essex; or of the Auctioneer, Barfield Road, West Mersea.

THURSDAY, SEPTEMBER 5.

Car leaves the Offices of the Company 9.15 sharp; Red Lion, High Street, Colchester, 1 p.m.

Dr. F. T. Bond has no hesitation in accounting for the unquestionable influence of schools in diffusing the infection of diphtheria, and possibly some other forms of infection. He says:—"The effect of the dry sweeping of floors is to raise a cloud of fine dust, which, even if it has been precipitated before the children enter the rooms, must settle on the forms and desks, to be easily dislodged and lifted again into the atmosphere of the room by every movement of the children, and especially by the stamping with which it is their custom to accentuate their march in and out of them," and proceeds to recommend the application of disinfectants to the floors.

The following school authorities have adopted routine disinfection of their schools:—Nottingham, Durham, Middlesex, Leeds, Birmingham, Willesden, Dundee, West Ham, East Riding Yorks, &c.

Despite the pessimistic and fatalistic views entertained concerning the stamping out of measles, scarlet fever, &c., I affirm that these conditions are preventable, and that by proper isolation and disinfection they can be controlled. It is well known that in the history of an epidemic of infectious disease, as the causal microbe passes from patient to patient it acquires a more and more exalted toxicity. Let it be ceded that in a certain instance the bacterial cause cannot be wholly destroyed, and that individual cases of the particular disease occur; in such circumstances much benefit will accrue to the community if an epidemic can be prevented. If in the past discredit has been wrongfully thrown on this most important department of practical preventive medicine, it was by reason of lack of thoroughness in the application of the disinfectants selected or by the use of inefficient preparations. With the introduction of the Rideal-Walker method of test, which provides a ready means of controlling the efficiency of disinfectants, and the many excellent spraying machines which are now to be had at moderate prices, it is to be hoped that some real progress may now be made along the lines indicated.

It must be obvious to all intelligent minds that in attempting to control any of these diseases it is necessary, at the earliest possible moment, to resort to the use of suitable and efficient disinfectants. It is, therefore, of the first importance that all school teachers, managers and parents should be thoroughly educated in the methods of

recognising the initial symptoms and main clinical features of such infections and in the application of efficient infectants.

Apart from the necessity of disinfection in the interest of the children themselves there is another aspect of question which may perhaps have a more stimulating effect in the desired direction.

Writing in the *Educational News* of July 19 on the subject of the Workmen's Compensation Act, 1906, as it applies to school teachers, Mr. T. A. Organ, a recognised authority on educational law, says, in reference to infectious diseases, that while it is his opinion that the Act does not cover the case yet, in view of the fact that the House of Lords recently supported the decision of a county court judge who awarded compensation for death from infectious disease, the county court judge having found as a fact that the disease and consequent death was caused by the accidental alighting of a bacillus on a part of the deceased's person, which offered harbour in which the bacillus grew and multiplied, he "can conceive how a case could be shown which would have for its object the obtaining of compensation for a teacher who 'caught' scarlet fever from one of his scholars."

There seems reason to hope, therefore, that school authorities may at length be impelled by motives of interest to the systematic disinfection of their premises will indeed be a striking commentary on their sense of public duty if legislation should step in and provide the direct means of introducing a reform demanded no less by humanity than by common cleanliness and decency.

### TRADES TRAINING SCHOOLS.

The schools in Great Titchfield Street, of which Mr. Phillips Fletcher is director, have again proved themselves deserving of the attention of workmen. The joint committee consists of members of the Worshipful Companies of Carpenters, Joiners, Painter-stainers, Plasterers, Tilers and Bricklayers and Wheelwrights. The judging committee comprised among the members Mr. T. E. Collett, Frampton, R.A., Mr. R. Blomfield, A.R.A., Mr. Gossett, John, A.R.A., Mr. Banister Fletcher, Mr. S. Stevens, He

## ERNEST MILNE

Architectural Photographer,

Expert in Photography connected with LIGHT AND AIR, OF WAY, DILAPIDATIONS, BOUNDARIES, &c.

Thirty years' experience.

Over Ten Thousand Photographs taken on Public Works for leading London Contractors. Prices moderate. Estimates free. Proofs in few hours if required.

All Photographs taken personally by Mr. Milner.

80 THE GROVE, WANDSWORTH, S.W.

T. Rider, Mr. G. J. Newson. The following reports suggest the character of the work executed by the students:—

**Carpenters.**—The judges consider that the work in this of anything, more creditable than last year. A good average is shown, and some very excellent work is exhibited.

**Joiners.**—The attendances of the students appear to be at the same as usual, but the judges regret that there are so many unfinished exhibits. They understand, however, that this is due to the fact that many students found work in the provinces after joining the class.

**Handrailing.**—The judges are pleased with the exhibits, the quality of the work being of an excellent character.

**Masons.**—The simpler forms of masonry have been completed this year, and the judges are glad to find that so many young students are taking advantage of this class.

**Painters.**—The judges consider that the specimens of work well maintain the traditional excellence of this class.

**Plasterers.**—The judges are glad to find that as the work goes on, they have had considerable difficulty in making their awards, and they wish to express their appreciation of the work exhibited.

**Plumbers.**—The judges considered last year that the water mark of excellence in this class had been reached, and they are astonished to find that the work this year is of a higher character than heretofore. The best principles of plumbing have been followed out, and the designs of the pipework show that sound theory, as well as practical practice, forms part of the training of this class.

**Smiths.**—The judges regret that much work has not been completed, and trust that next year more will be placed before them, and also that some of the work commenced this season will be completed.

**Stone-carvers.**—The judges are pleased to find that the work in this class is still satisfactory, and they hope that it will continue to maintain its standard of excellence.

**Life Class.**—Messrs. George Frampton, Reginald Blomfield, Goscombe John and Banister Fletcher wish to express their appreciation of the very marked improvement in this class, and they appreciate the enormous advance that has been made.

**Tilers and Bricklayers.**—The judges are glad to find that

the work is quite up to the usual standard, the knowledge of technique and skill displayed being most meritorious.

**Wood-carving.**—The judges are very pleased to find so much excellent work exhibited; they would, however, suggest that more models be added to the collection for the use of the student, and they have requested Mr. Blomfield to make some suggestions with regard to such models. They would also like to remind the students of the necessity of studying the suitability of the design and the material they are working.

The photographic illustrations in the report confirm the opinion of the judges. As the average fees are only 5s. a term for adults and 3s. for apprentices, the advantages of the schools are attainable without inconvenience by all workmen.

#### ADMINISTRATION OF LONDON.

THE report of the engineer of the City of London (Mr. Frank Sumner) for 1906 is a belated document, for the items almost appear as if they were ancient history. For instance, it is stated that on May 5, 1905, the Corporation, in consequence of complaints having been made of the manner in which trenches were opened and reinstated in the public ways, decided to issue new regulations to all bodies, companies and persons excavating trenches. These regulations now provide that the concrete shall be splayed off on either side of the trench clear of the excavation made for the same, so as to form a key over the opening and thus prevent the pavement from afterwards subsiding. The regulation also provides that the concrete is to be at least the full thickness of the existing concrete beneath the pavement even when the concrete is 12 inches or more in thickness. Questions having arisen as to this method of repairing over trenches, fresh plans and sections showing the method in which the Corporation varied their requirements were prepared and served upon all the public bodies and companies.

Concerning the demolition of buildings, it is said that during the year applications have been received for permission to erect hoardings for the demolition of buildings at various sites within the City. Great difficulty is experienced in seeing that the by-laws are carried out in their entirety,

Telegraphic Address: "IRONFOUNDERS, OLDHAM."  
National Telephone: 161 OLDHAM.

but every effort is being made to enforce them, particularly with regard to the usage of a plentiful supply of water, and also close boarding the whole of the site.

Architects will be glad to learn as exemplifying a liberal interpretation of the building regulations that it was decided not to offer any objection to the construction of oriel windows in front of the premises No. 7 Wood Street and No. 51 Fetter Lane; the erection of balconies in front of the premises Nos. 110 and 111 Fleet Street and No. 60 Fenchurch Street; or to the erection of an iron and glass awning over the public way in front of Blackfriars station of the District Railway.

The quantity of water used during the year for washing streets and courts was 60,730,990 gallons. Frequently the streets are not sufficiently wet for squeegeeing, but are in a greasy or pasty condition. Mud scrapers were then formerly used, but this practice is now almost discontinued on main streets, it being found a more effectual remedy to water the surface of the carriageway by water vans and to squeegee immediately afterwards. This system has proved an inestimable boon to the motor traffic, but of course it is quite impossible with the enormous traffic and the great area of street surface to cleanse in this way more than the main thoroughfares.

### UNADOPTED ROADS.

In his report to the Handsworth Urban District Council on the work in the surveyor's department, Mr. H. Richardson talks plainly about the large number of roads which have been partly formed as private speculations, and which combined are about fourteen miles in length. According to him a large proportion of these roads are of no use to the general public as thoroughfares, but have simply been made to suit the purposes of the landowner and to "make frontage." The Council have no legal power to require the streets to be laid out on useful lines, so that every separate little estate when taken in hand by some speculating builder, syndicate, or company is developed in a selfish way, and entirely without regard to the connecting up of thoroughfares. The result is a labyrinth of roads "leading to nowhere." "It is doubtful," adds the surveyor, "whether some of these persons would trouble to make any street at all

if it were lawful to build the houses in one solid mass slums. After the roads have been laid out, the land let on lease, buildings erected and tenants enticed into the roads the landowners can walk away with their ground rent secure in their pockets; and even though they leave roads unmade, unpaved and unlighted, they have no further responsibility in the matter so far as the Council is concerned, as the cost must fall on the owners of the houses. 'Why don't the Council do something?' The first reply must be another question—'What can they do?' People who have but that little knowledge which is dangerous to reply glibly enough, 'Take the roads over,' or 'Send notices to make them.' The first course, viz. to take over the roads or some of them would be illegal because under section 152 of the Public Health Act 1875, it is only when a road is properly completed that the Council are empowered to declare it to be a highway repairable by the inhabitants at large. The second course, viz. to take proceedings for the making of the roads, is one which is being carried out by the Council as rapidly as finances will admit." The surveyor makes the further remark that only those who have had the work to do can appreciate the mass of information which has to be gathered together with reference to the various properties in a road before the statutory notices can be served, but the great difficulty is the finding of the money for the carrying out of the work. This has to come out of the current rates. The Council at the present time have on hand eight roads of various parts of the district, the completion of which will cost 7,355*l*. In the surveyor's opinion it is grossly unwise to keep taking large sums out of the rates for the purpose of carrying out the neglected duties of these properties. This, of course, would not matter if the roads were repaid during the same year in which it is expended but it is often over twelve months before some of the money is recovered.

The Mullingar Rural District Council invite the submission before September 18 of plans, estimates and specification for a main drainage system for the town of Mullingar. A premium of 50*l*. will be awarded to the successful competitor.

## CONTRACTS FOR CHAIRS.

ERS were recently solicited from twenty of the leading manufacturing firms in High Wycombe, Buckinghamshire, for the supply of 30,000 chairs for the War Office for the use of soldiers' quarters, but to general surprise none of the tenders were entertained. Mr. J. O'Grady, M.P., the organiser of the National Amalgamated Furnishing Trades Association, has been approached on the subject, and he has written to the local association, saying:—"I have been interviewing Mr. Acland, M.P., secretary to Mr. Asquith, the War Minister, on the matter, and the position is—'the employers have taken our advice to come to an agreement among themselves not to undercut each other by offering prices. Tenders from twenty firms have been received, all at the same prices, for the chairs required for the War Office. The authorities see in this a 'ring,' and, in order to avoid a precedent against 'rings' of employers, the War Office have stopped the contracts being issued.'" A meeting has since been held at Wycombe, where the local association has decided to send the following resolution to the Prime Minister and Mr. Arnold Herbert, M.P. for South Essex:—"That this meeting strongly disagrees with the action of the Government in withholding these contracts in consequence of a movement to stop the sweating system, not only with the men but also the masters, and urges that the tenders be reconsidered and given out at once."

## ELECTRIC ENERGY IN FACTORIES.

regulations for the generation and transformation, as well as the distribution and use of electrical energy on all premises under the Factory Act, and at all pressures above 100 volts continuous and 65 volts alternating, will soon be issued from the Home Office. They are intended to cope with the dangers which may arise from lower pressure than has been recognised. The official memorandum on the subject says:—

"At many points it has been thought to be more expedient, in view of the rapid development of electrical engineering, to indicate broadly the dangers to be avoided and the nature of the precautions required than to define particular means

of securing the necessary safety. It appears often to be thought that where the supply of electrical energy is at low pressure there is no danger of shock, or rather that there is no danger to life from a shock at such pressure. It has, however, been abundantly proved that this is not the case. Fatal cases of shock at low pressures are by no means of rare occurrence. Accidents from shock may occur by a person making contact simultaneously with two live conductors at different pressures, but more usually by merely touching one conductor whilst being in contact with the ground. A mere momentary contact with a conductor at low pressure, even when standing on damp ground, may not produce a serious shock, but a person who happens to grasp the conductor may be quite unable to release his hold and the shock is prolonged until assistance comes. In such circumstances it may take only a few seconds for the shock to prove fatal. The dividing line between the conditions which will render the shock merely trifling and those which will render it fatal is so narrow that it becomes necessary to provide, so far as is practicable, that no shock shall be received at all."

## FUTURE SUPPLY OF IRON ORES.\*

THERE is only too good reason to fear that the chief iron ores are comparatively limited in depth, for most of them have been formed by water containing oxygen and carbonic acid in solution, which has percolated downward from the surface. Ores thus formed are therefore restricted to the comparatively limited depths to which water can carry down these gases. On the theory, however, that these ores are primary segregations from deep-seated igneous rocks there need be no limit to their depth. They would rather tend to increase in size downward, while maintaining, or even improving, in the richness of their metallic contents. For these bodies may be regarded as fragments of the metallic barysphere which have broken away from it and revolve around it like satellites floating in the rocky crust. On this conception these ore bodies would be of as great

interest to the student of the earth's structure as their existence would be reassuring to the ironmaster, haunted as he is by constant predictions of an iron famine at no distant date. It is no doubt true that many of the richest, most accessible, most cheaply mined and most easily smelted iron ores have been exhausted. The black-band ironstone and the clay iron ores of the coalfields, which gave the British iron industry its early supremacy, now yield but a small proportion of the ores smelted in our furnaces. The Mesozoic beds of the English Midlands and of Yorkshire still supply large quantities of ore. Nevertheless the British iron industry is becoming increasingly dependent on foreign ores. So it would be pleasant to find that the Scandinavian iron mines are not subject to the usual limits in depth. I fear the typical iron deposits of Middle Sweden and of Gellivara will follow the general rule; but Kiruna may be an exception, and its ores may continue far downward along the surface of its sheet of porphyrite. The uncertainty in this case lies in the extent of the subsequent enrichment and enlargement of the bed. If most of the ore is due to secondary deposition, then it may be restricted to the comparatively shallow depths at which this process can act, and though that limit will be of no practical effect for a century or more to come, the ore deposit may be shallow as compared with gold mines.

The geological evidence may convince us that all the economically important iron ores are limited to shallower depths than lodes of gold, copper and tin, but this conclusion shall not enroll me among the pessimists as to the future of the iron supply. Twenty years ago a paper on the gold supplies of the world was read to the Association at the request of the Section of Economics. About the time that the report was issued there were sixty-eight mining companies, with a nominal capital of 73,000,000*l.*, at work upon the Rand. Nevertheless the author, accepting the view that "the future of South African gold-mining depends upon quartz veins," concluded:—"There is as yet no evidence that the yield will be sufficient in amount to materially influence the world's production. As regards India, the prospect is still less hopeful."

That quotation may be excused, as it is not only a warning of the danger of negative predictions, but of the unfortunate consequences that happen when geologists are

unduly influenced in geological questions by the opinion of those who are not geologists. In economic geology in theoretical geology, we should have greater confidence in the value of geological evidence. Negative predictions are especially rash in regard to iron, it being the most abundant and widely distributed of all the metals. A geologist, who knows the amount of iron in most boulders, finds it difficult to realise the possibility of an iron famine. He can hardly picture to himself some ironmaster complaining of "iron, iron everywhere, and a ton to smelt." There are reserves of low grade refractory materials which the fastidious ironmaster can now use, since competition restricts him to ores of exceptional richness and purity. When the latter fail, an unlimited quantity could be made available by concentration processes. The vast quantities of iron ores suitable for present methods of smelting in Australia, Africa and India show that the practical question is that of supplying existing iron-working localities, and not of the universal failure of iron ores.

#### MERSEA ESTATES.

For many years Essex as a field for residence has been the victim of prejudice. It might be supposed that people have imagined the dreariness of the east of London because it is intensified if anyone would venture across the boundary separating Middlesex from Essex. Happily there is a reaction, and Essex is fast becoming a favourite region for Londoners who seek picturesqueness and repose. One part which should have been long ago utilised by investors and builders is Mersea Island, which must have afforded inspiration to Mr. W. W. Jacobs, for his favourite characters are racy of the soil. On Thursday next another portion of the Queen's estate will be sold by auction by Mr. J. Gardner, of West Mersea; and anyone who is in quest of a site or sites in the balmy air, and not fifty miles from London, will do well to attend. It will be evident that the position is without exaggeration.

6-11 IMPERIAL BUILDINGS,  
LUDGATE CIRCUS, LONDON, E.C.

Dear Sir,—We beg to call your attention to the above paper, which appeals directly to a large section of the public. It is practically a new paper—grafted on two old-established periodicals with which it is now incorporated and gives a full reflection of the building industries. Its pages contain information useful to all; it should be carefully studied from end to end.

Issued to meet the trend of the times at a popular price, it contains as much of everything interesting to be engaged in building operations as any of the higher priced papers.

It is not too much to say for ourselves, and we state it with every confidence, that a year's subscription to "THE BUILDING TRADE" is one of the best investments anyone connected with the industry can make.

We trust we may have your assistance in making our new venture a great success, and shall be glad if you will fill up the accompanying Order Form and forward it as soon as possible.

Faithfully yours,

GILBERT WOOD & CO., Ltd.

P. A. GILBERT WOOD, Managing Director

## NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

## EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

## TENDERS, ETC.

\* \* \* As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

## COMPETITIONS OPEN.

LONDON.—Oct. 14.—The Acton District Council invite architects who have been in practice for at least seven years to send in to Mr. Wm. Hodson, clerk, 242 High Street, Acton, W., before Oct. 14, designs for erection of the proposed Council offices, at a cost not exceeding 18,000l. An assessor will be appointed, and premiums of 100 guineas, 50 guineas and 25 guineas will be awarded for the designs selected by the Council after their consideration of the assessor's award. Particulars can be obtained upon the payment of 10s. 6d.

LONDON.—The Rugby Football Union offer premiums of 25l., 15l. and 10l. for the best designs for two stands to be erected on their ground at Twickenham. Further particulars from Secretary, Rugby Football Union, 35 Surrey Street, Strand, London, W.C. Deposit, returnable, of 10s. for particulars.

## CONTRACTS OPEN.

AMBLE.—Sept. 23.—For erecting County school to accommodate 220 scholars at Amble, Northumberland. Deposit 2l. 2s. Mr. C. Williams, secretary, Pearl Buildings, Newcastle-on-Tyne.

BEDFIELD.—Sept. 9.—For enlargement of Bedford Voluntary school. Mr. Charles Ling, Bedford, Framlingham, Suffolk.

BIRMINGHAM.—Sept. 10.—For erection of telegraph stores. Deposit 1l. 1s. The Secretary, H.M. Office of Works, &c., Storey's Gate, London, S.W.

BURLEY-IN-WHARFDALE.—Sept. 14.—For erection of coal store and cowhouse at the Scalebar Park. The Clerk of Works, Scalebar Park, Burley-in Wharfedale.

CHESTER.—Sept. 16.—For public elementary school for 600 boys and girls, to be erected in Love Street. Deposit 1l. Mr. H. Beswick, architect, Newgate Street, Chester.

# LUXFER SASH CANOPY SKYLIGHT PAVEMENT PRISMS

**ESTIMATES FREE.****THURSDAY, SEPTEMBER 12.****TWO GREAT EVENTS, 1837-1907.**

1837

Was the year in which the late Queen Victoria commenced her  
GLORIOUS REIGN.

To commemorate the 70th Anniversary of her  
happy event, we have in

1907

Commenced to lay out a Building Estate in the  
glorious Island of Mersea, and named it

**THE QUEEN'S ESTATE,  
WEST MERSEA, ESSEX.**

THE Estate is situated in the best portion of the Island, is well wooded, and enjoys a good frontage to the main roads. The Island is at the confluence of the Colne and Blackwater, and enjoys the reputation of the healthiest portion of the East Coast. It has a south-east aspect, and enjoys a maximum amount of sunshine, ably situated for fishing, boating, shooting, and other sports. It is 40 miles by road from London, 18 miles from Clacton, and 8 miles from Colchester, and affords a rendezvous for motorists, cyclists, and others. The excellent service of G.E.R. motor buses from Colchester, North Station, and also a service of motors and horse-drawn carriages from Colchester High Street. The Island has been described as

**"THE RIVIERA OF ESSEX."**

Instructions have been given by the Proprietor

**MR. J. H. GARDNER**

To OFFER for PUBLIC SALE, on Thursday, September 12, 1907, in a Marquee upon the Island, The First Portion of the Queen's Estate.

**200 FREEHOLD PLOTS**, about 150 of which have frontage to the Sea, to Empress Avenue, and the remainder have important frontages to the main road. This is a unique opportunity for the securing of suitable sites for the erection of bungalows, houses, shops, &c. Mersea Island is fully described in "The Building Estate," published April 24, 1907.

Arrangements will be made for the conveyance of purchasers by motor and rail from London, Clacton, Colchester, and other places; also by ferry from Brightlingsea, Mersea, thence by motor to Queen's Estate. Luncheon will be served in the Marquee before Sale.

Luncheon at 2.30 p.m. Sale commences at 3.30 p.m.

Free Conveyances. Plans and Particulars will be ready after the 24th and may be obtained from the Vendors' Solicitors, Messrs. Turner and Hawkins, 8 High Street, Colchester. J. J. Edwards, The Queen's Mersea Estate Offices, 90-91 Street, Queen Victoria Street, London, E.C.1; the Mersea and Iron Company, Ltd., Sea View Road, West Mersea, or of the Auctioneer, Barfield Road, West Mersea.

**THURSDAY, SEPTEMBER 12.**

Car leaves the Offices of the Company 9.15 a.m. Red Lion, High Street, Colchester, 1 p.m.

WOLSTANTON.

For erecting fire-station and rate collector's office. Mr.  
W. F. SLATER, architect, Burslem.  
WARDLE, Longport (accepted) . . . . . 648 0 0

THE sum of 265*l.* per acre for vacant land in the  
hills of Central Wales is the average result of Messrs.  
Knight, Frank & Rutley's sale at Llandrindod Wells on  
Tuesday, when the Middleton Evans Estates were offered  
before a crowded assembly in the Victoria Hall. In addition  
to local buyers, many attended from London, Swansea,  
Cardiff, &c. The whole property, which includes the Pump  
House Hotel, was first offered in one lot, and ultimately  
withdrawn at 105,000*l.* The available building land was  
then put up in lots, prices for which yielded the above-  
mentioned result. Notwithstanding the growth of Llan-  
drindod Wells in recent years, the present accommodation  
is far short of the requirements of the place in the season,  
and as several of the lots not sold under the hammer were  
disposed of during the afternoon, there is little doubt that  
those remaining will be speedily dispersed, and that a great  
development will shortly take place in the addition of new  
public and private buildings to meet local wants.

TRADE NOTES.

REIGATE Grammar School has been ventilated on the  
"Boyle" natural system, under the direction of Messrs.  
Baker & Penfold, architects, Reigate.

THE directors of the Bath Stone Firms, Ltd., have  
declared an interim dividend for the first half of the year at  
the rate of 8 per cent. per annum, which is the same as in  
the corresponding half of last year.

WE are informed that Mr. Benjamin A. Tapp, who for  
the past twenty-years has represented Messrs. Geo. Vint &  
Bros., has decided in consequence of that firm retiring from  
business to continue his connection with the stone trade as  
a quarry agent supplying Yorkshire or West of England  
stone. Mr. Tapp's temporary address will be Elm Villa,  
Whitton Road, Twickenham, S.W.

MESSRS. THOMAS CRAPPER & SON, the well-known  
sanitary engineers and specialists, of Marlborough Works,  
Marlborough Road, Chelsea, S.W., inform us that they are  
removing into more commodious premises on October 1,  
and their address from that date will be 120 King's Road,  
Chelsea, S.W.

THE new clock of the Ilkley new town hall, made and  
fixed by Messrs. Wm. Potts & Sons, Ltd., Leeds and New-  
castle-on-Tyne, from Lord Grimthorpe's designs, was  
formally set going on Saturday last. Other clocks by the  
firm are in use at Ilkley, viz. in the parish church, the  
Congregational church and the large clock at the Joint  
Railway station, and many other large clocks in this  
district. Their police courts tower clock, Sunderland, is  
now in action.

THE Kahn system of reinforcement of the Trussed  
Concrete Steel Co., Ltd., is advancing in favour with archi-  
tects and engineers. Among the works executed during  
the last two months are the following, which show the  
adaptability of the ingenious trussed bars:—Storehouse,  
Great Malvern; two retaining walls, Tottenham; lintels,  
Dublin; extension of Swanscombe Pier, Swanscombe;  
five-storey office block, Lloyd's Avenue; foundation raft,  
Purfleet; lintels, Newcastle Emlyn; office block, H.M. Land  
Commission, Dublin; flour mill, Brixham; engine founda-  
tion, Glasgow; coal hopper, Blackburn Gas Co., Blackburn;

B. N. SNEWIN & SONS, LTD.

ENGLAND is remarkable for the variety of building materials with which it is enriched. One which with such a climate as ours is essential is wanting. We refer to asphalt. Attempts have been made to produce substitutes to which the name is applied, but for once nature is superior to ingenuity. Even abroad the supply is extremely limited. Messrs. Thomas Faldo & Co., Ltd., as the sole concessionaires for Great Britain and North America of the Seyssel Mine, known as Les Mines de Bourbonges à Lovagny Bassin de Seyssel (Haute Savoie), France, are in a position to employ the most satisfactory variety. Since 1851 they have applied it to almost every variety of structure—bridges, hospitals, municipal buildings, prisons, theatres, warehouses, piers, flats, factories, breweries, colleges, banks, &c. They have issued a brochure which contains useful information about the material and its applications, which being derived from long and varied experience is worth remembering.

MESSRS. E. H. SHORLAND & BROTHER, warming and ventilating engineers, of Manchester, have found from practical experience that where inlet ventilators have been fixed for a length of time the interiors frequently become very dusty. This firm have therefore introduced a new ventilator, which they describe as Shorland's No. 221 design latest patent hygienic inlet ventilating panel. This inlet ventilator is made so that by one movement only the front can be removed, thus allowing for the whole of the interior of the ventilator being cleaned at any time from the inside of the room where it is fixed. The advantage of this easy and expeditious method of cleaning will at once be apparent. There is no necessity to go outside the building to remove the air grating in the outer wall to gain access to the inside of the ventilator. Further particulars may be had from the patentees.

### VARIETIES.

THE dock management committee, sitting at Boston, decided to recommend the Boston Town Council to erect a new coal hoist at the dock, with the necessary additions to the power station, and a new boiler, engine and turntable, at an estimated cost of 7,500*l*.

THE committee of the Moravian Church, Fetter Lane, E.C., have secured a site in Priory Lane, Hornsey, on which to erect a church for the convenience of its North London members. Plans have been approved for a building which will accommodate over 350 persons, and will cost about 5,000*l*.

At Hamilton Dean of Guild Court, a petition was presented by Hamilton Baptist Church for the erection of a church and halls at the corner of Kemp Street and the new street recently opened by the Town Council. The plans showed a building capable of seating 590 persons, with a large hall having accommodation for 462 and a lesser hall seated for 133. The estimated cost of the new building is about 5,000*l*. The plans were passed.

THE Rochdale electricity committee have decided to apply to the Local Government Board for sanction to borrow 22,175*l* for electric-lighting purposes. The Corporation also contemplate spending about 25,000*l* on providing new baths. New slipper and swimming baths at Castleton are to cost 10,900*l*, an additional plunge bath at Smith Street will cost over 8,000*l*, and about 5,600*l* will be spent on slipper baths at Lower Place.

THE Lord Mayor of Liverpool has received a letter from Mr. F. G. Parsons, National Amalgamated Society of Operative House and Ship Painters and Decorators, Liverpool, No. 1 Branch, with reference to painting work being done by labourers at the generating station, Highfield Street, and also at Lambeth Road car shed. Regarding this complaint Mr. Morrissey has given notice of motion that it be an "instruction to all heads of departments that none but competent artisans be employed in painting and other work of a skilled nature, as the employment of labourers upon this kind of work is detrimental to the interests of the ratepayers, leading to scamped work and inefficiency of the public service."

MAJOR J. E. STEWART, R.E., Local Government Board  
ector, held an inquiry at the town hall, Warrington, on  
ay, into the application of the Corporation for sanction  
row 40,140*l.* for street widenings and improvements,  
071*l.*, the sum required in connection with the pro-  
boiler-plant extensions at the electricity works.

RE special sub-committee of the Scarborough Harbour  
missioners, appointed to consider details with regard  
e harbour improvement scheme, have approved the  
and specification produced by Mr. I. D. Howkins, the  
eer, for the widening of the West Pier and the deepen-  
f the harbour, and these were approved by the sub-  
ittee, who had been given power to act. The engineer  
nstructed to advertise for tenders for carrying out the  
at once. The scheme is estimated to cost between  
0*l.* and 15,000*l.*

RE Bolton waterworks committee have confirmed the  
tion passed on July 31 accepting the following  
rs:—Messrs. John Best & Sons, Ltd., Edinburgh, for  
onstruction of the Delph reservoir (Contract No. 1);  
s. Glenfield & Kennedy, Ltd., for supply and fixing  
shaft, lining and standpipe, footbridge, sluice valves,  
Contract No. 2), required in connection with the pro-  
Delph reservoir; Staveley Coal and Iron Company,  
for supply of cast-iron pipes (Contract No. 3), required  
nection with the proposed Delph reservoir.

RE large majority of the trade union organisations of  
any are affiliated to the General Commission of  
Democratic Trade Unions at Berlin. In a recent

number of the organ of this central body statistics are  
given showing the remarkable growth of this group of  
unions between December 31, 1905, and the same date in  
1906. On the former date the total membership amounted  
to just under 1½ million, at the end of 1906 it was over  
1¾ million. There was thus an increase of over a quarter  
of a million. The membership on December 31, 1905, of  
those connected with the building trades was 307,878. On  
the same date in 1906 it was 382,567.

AN old pit-shaft has been discovered at Bilston under  
3 Crown Street. For some time past water has percolated  
into the cellar. The nuisance became so serious that work-  
men were called in to ascertain where the water came from.  
The floor of the cellar was removed, and the men then  
found the dome of a pit shaft a few inches below the floor.  
On removing the dome it was ascertained that the shaft  
contained from 40 to 45 yards of water. It is now thought  
that the water rose occasionally so high as to force its  
way into the cellar. The shaft is two yards wide. It is  
now being made secure. It is remarkable that a house  
should have been erected over a pit shaft, and that no one  
now living should have known anything about it.

THE Local Government Board have refused to sanction  
the purchase by the Salford Board of Guardians of the pro-  
posed site on the Crescent on which to erect offices. At  
the inquiry held by an inspector of the Board there was  
considerable opposition to the proposal. The Local Board,  
in their letter to the guardians, state that they consider  
the price for the site excessive. They further deprecate  
the building of new offices on the Elms site, as was advo-  
cated by the opposition, because of insufficient area, or the  
remodelling of the present offices in Eccles New Road for  
the same reason. The Board are, however, of opinion that  
new offices are required.

A REMARKABLE accident happened on the Manchester  
Ship Canal on Saturday. The great swing-bridge crossing  
the canal at Trafford Road was being turned to enable a  
vessel to pass along the waterway when something went  
wrong with the rollers, and after moving a few yards the  
bridge came to a standstill. Engineers were soon on the  
spot, and it was found that the faulty rollers would have to  
be replaced, and the traffic across the canal was necessarily

## KAHN SYSTEM REINFORCED CONCRETE.

53 CAXTON HOUSE, WESTMINSTER, S.W.

stopped and had to be diverted. The bridge is 205 feet long and weighs 1,800 tons. It has a span of 75 feet, is 30 feet deep, 50 feet wide and is the largest of its kind on the canal.

A SCHEME of dock extension is being drawn up for the port of Havre in order to obviate the delays in dealing with cargoes which have been customary for years past. The new works already in hand include the construction of a communicating channel between the Bassin Ballot and the Canal de Tancarville, which should be finished in 1909, according to an official report just issued. It is also intended to render the Bassin dock accessible to large cargo steamers and to provide an additional quay space of about  $1\frac{1}{2}$  mile. There is a great want of quay space for the regular lines frequenting the port, and the scheme now outlined includes the construction of a dry dock capable of receiving the largest steamers that are likely to be built. For these extensions the bed of the Seine to the south of the Eure dock will in all probability be utilised. The expense of these extensions is estimated at 2,500,000*fr.*

An influential Glasgow firm has acquired the right of working the Balephetrish marble quarry in Tisee, and four German experts have arrived on the island for the purpose of making arrangements with respect to plant and other matters of detail. Actual excavation will shortly commence, and employment will be given to a considerable number of local workpeople. The predominant rock on the island is gneiss, but masses of primitive limestone are abundant. The limestone has been long and favourably known for the fine, flesh-coloured marble into which it can be cut for ornamental architecture. Although somewhat harder than many foreign marbles, it possesses a rare beauty which for many years commended it to public patronage. The Duke of Argyll is sole proprietor of Tisee.

A SPECIAL meeting of the Salford District Council was held last week to consider the position created by the refusal of the Local Government Board to sanction the proposed sewerage scheme estimated to cost 75,000*l.* The Board pointed out that the proposed site for the purification works was unsuitable, that the works would be inadequate to deal with the sewerage of the district, and that the

scheme could not be carried out at the estimated cost. This a letter was sent in reply, practically adhering to the suggested scheme, and asking that the Board should send a deputation on the subject. After a long and animated discussion it was decided to approve and confirm the letter sent by the clerk.

REPORTING to the Washington Bureau of Manufactures with regard to lime "béton," Mr. R. P. Seely (United States Consul at Marseilles) says that this has been in longer and more general use in France than cement. It was a first-class material when made of ordinary quicklime, and since hydraulic lime has been used it is better. A good lime béton can be obtained by mixing mortar and stones, gravel or cinders, mortar and good-sized stones making the best composition. But one-half of the houses in Marseilles have been built with this material, and thousands of the older buildings of hundreds years old are held together by ordinary mortar. Walls built of quicklime béton must be laid up slowly with hydraulic lime béton they can be erected as fast as masons can work. The solidity of lime béton construction is shown by the sea-walls and docks in Marseilles. The masonry of this kind can be seen both above and below sea water, the most difficult test to which building material can be subjected.

In the Vacation Court, High Court of Justice, Mr. Justice Pickford had again before him the motion of Moss's Estate, Ltd., v. Williams. Mr. Bramwell Davis, K.C., for the plaintiffs, stated that the motion was for an injunction to restrain the defendant from excavating sand near a pit, or for excavating at the side of the plaintiffs' property in Summer Hill Road, Birmingham. The evidence was a conflicting nature. There were affidavits by two experts on either side who were surveyors. The defendant's experts said that this could not be done. The question was whether the defendant was to be allowed to excavate on excavating at the risk of the plaintiffs' buildings coming down. Defendant's counsel said he was prepared to enter an undertaking not to excavate within 15 feet of the plaintiffs' boundary wall till the trial of the action.

EDWARD J. DOBBS  
Patentee and Proprietor

newell Davis accepted this offer. Upon a mutual understanding being given to the above effect, the matter stood till the trial of the action or further order.

For the man who is desirous of journeying from London to Doncaster for the whole of the race week special arrangements have been made by the Great Central Railway Company giving him not only to accomplish the journey in comfort at a very cheap fare. On Monday, September 9, a special motor car express will leave Marylebone at 1.15 P.M. fares, first class, 28s.; third class, 14s. On Wednesday Friday you may journey to Doncaster and back for 33s. 6d. first class and 18s. 6d. third class, including table d'hôte luncheon and dinner *en route*. The trains are timed to leave Marylebone on St. Leger Day at 8.40 A.M., and Cup Day at 10.15 A.M. Cheap excursion tickets are also available by the same trains—27s. first class and 13s. 6d. third class. For the convenience of passengers and to avoid the crowd at Doncaster station these trains will arrive at and depart from the new Bridge station, from which place electric cars run direct to the course. In this outing the railway company provides everything to contribute to the enjoyment and comfort of the visitor from London.

A SHORT distance to the west of Old Stakeford a ford hitherto constituted the only means of crossing the River Wansbeck, near North Seaton station, on the Northern Railway. As the ford in question is of dangerous character, especially during the prevalence of floods and storms, the highway authorities wisely decided to substitute a bridge, thus obviating all risk to the public and affording in a far more convenient manner for the conduct of traffic. The new structure was designed by Messrs. D. & Sons, civil engineers, of Newcastle-on-Tyne, and the operations were commenced in June last by the contractors, Messrs. Brims & Co., also of Newcastle-on-Tyne. The bridge has the total length of 264 feet between the piers, and comprises six girder spans 44 feet 4 inches centre to centre of the piers by 20 feet 4 inches wide. The piers are formed by driving Hennebique ferro-concrete down to solid rock, the piles being cased in Mouchel cylinders of ferro-concrete and the internal spaces filled with similar material. The abutments will also be constructed in ferro-concrete. According to contract conditions the bridge will be tested by a dead load of 1 cwt.

per square foot and the moving load of a 30-ton steam-roller, or of two 15-ton steam-rollers. It is stated that the adoption of ferro-concrete has resulted in a saving of 5,000*l.* to the ratepayers, the contract price being 7,000*l.*, as compared with 12,000*l.*, the estimated cost of a steel bridge.

A SPECIAL committee of the Birkenhead Town Council have issued a report upon the question of the payment of a minimum wage of 24s. a week to able-bodied Corporation employes, and whether such rate would be detrimental to the interests of employes who are over the age of forty, or who are below the standard of mental or physical strength. From the returns laid before them, the committee found that there were a considerable number of men in the employ of the Corporation paid less than 24s. a week who were not performing able-bodied work, and some of whom were not capable of performing such work. The majority were engaged in street scavenging. A number of them were old men and had been for several years in the employ of the Corporation. The special committee did not think it desirable in the interest of the men themselves to fix a minimum wage of 24s. a week for those men, or for any of the men who were engaged on a class of work which the committee did not consider to be able-bodied work. If a minimum rate of 24s. a week were paid by the Corporation for that class of labour the heads of the departments would no doubt feel obliged to look out for more capable men to replace a number of those at present employed, and the old and physically deficient men would consequently suffer. In answering specifically the terms of the reference, the committee considered that it would be desirable to adopt a minimum rate of wage of 24s. a week for the payment of the men who were able-bodied and performed able-bodied labour. From the returns furnished about 210 to 220 would be affected, and the increased annual cost of wages would be about 1,160*l.*, but it was contemplated that the increase might be reduced by 25 per cent. Further, the special committee did not consider that the minimum wage would be detrimental to the interests of the employes who were over the age of 40, or who were incapable of able-bodied work, if the wages of those labourers were not raised to the minimum of 24s. a week.

### THE SAFE OF THE FUTURE.

THE American Consul at Chemnitz, Mr. Thomas H. Norton, says that the confidence of German manufacturers of safes in the resistance of their wares against ordinary safe-blowing operations has been rudely shaken by the recent achievements of a single unaided robber in Dresden and other cities. The details of his last operation are as follows:—In an hotel a room was secured which was situated immediately above the office of a moneychanger. At night a hole was pierced in the ceiling of this office. By the use of a drill and saw a circular piece of the flooring was easily raised. Beneath lay a thick layer of cement. A small orifice was made in this, and an umbrella pushed down into the space below. The umbrella was attached firmly from above, and when opened received without noise all the fragments of cement which were dislodged as the hole was enlarged so as to allow of the easy passage of a person. By means of a rope ladder the descent was readily made into the office below. Curtains were drawn, and with heavy blankets a tent was constructed around the safe, so thick that no ray of light could pass through. Next the robber brought down two cylinders of compressed oxygen and an acetylene generator charged with calcium carbide and water. With these he was able to produce a blowpipe flame of such intensity that steel fuses in it like lead in an ordinary gas jet. It required but a brief space of time to melt away so much of the door that all the contents of the safe were accessible. They were carried to the room above. At an early hour the robber left his lodgings and disappeared without trace.

It is evident, says the Consul, from this experience, that the builders of safes must provide for new contingencies in their construction. The simple, light acetylene generators now in widespread use, and the equally simple oxygen generators, charged with water and sodium peroxide, or the heavier cylinders of compressed oxygen, place at the service of the intelligent "crook" the possibilities of opening the strongest safes in existence rapidly and noiselessly, provided the operator can be screened from observation. Some large safes are so disposed that they are under frequent observation by watchmen looking through the windows. Usually this observation is confined to the doors of bank vaults or

the like, although in the case of the globular safes it practically extends to all exposed sides. In the greater majority of cases existing safes would offer next to no difficulty to a skilful cracksmen if able to work without being seen. It is evident that owners will be forced henceforth to adopt measures as will reduce to a minimum all possibilities of access to free-standing, movable safes, or the hidden safes embedded in cement or masonry. Manufacturers of safes will, on the contrary, be impelled to fight the scientific burglar with his own weapons. In somewhat the same fashion by which time locks prevent the opening of a safe during certain hours, it will be comparatively easy to introduce into safe construction chemico-mechanical devices which, during a limited time, would render it either fatal or physically impossible to remain in the vicinity of a safe or vault where the walls or door tampered with to an extent as to allow access to the interior. By the use of a very simple form of apparatus containing potassium cyanide and sulphuric acid a robber would expose himself to the deadly fumes of prussic acid. Less dangerous, though with possibilities of accidents to those regulating a safe, would be the employment of substances which, by crippling a safe blower or forcing him to an instantaneous retreat. The volatilisation of a few drops of ethyl-dichloroacetate would cause such profuse and persistent weeping that one in the immediate neighbourhood would be temporarily blinded if he persisted in remaining. The blowing of a tube of liquid ammonia would render immediate withdrawal imperative under peril of suffocation. Several similar compounds are at the service of construction. Eventually the daring burglar, with sufficient scientific training, might venture to face the unknown dangers of a safe well provided with more or less effective neutralising agents for the concealed possibilities of defence; but, certainly for some time, at slight expense, effective protection can be devised against the attack of the scientific cracksmen with his portable oxy-acetylene blowpipe.

THE Bonhill School Board have agreed to enlarge the Vale of Leven Academy at an estimated expenditure of 5,000*l.*, also an enlargement of Jamestown school at an outlay of 2,000*l.*

### DE LAITTE GAS.

history of artificial light, although dating from the earliest stages of man's existence, can be divided into very many chapters, giving one to each of the following methods: candles, oil lamps, gas lighting, electric lighting and acetylene-gas lighting. Leaving out the first of these, which has long been relegated to the position of a decorative agent, undoubtedly the greatest advance was made when coal gas was successfully applied as an illuminant, rendering oil lamps obsolete; for although the discovery of electric lighting, with its wonderful possibilities, long turned into actualities, was an epoch-marking event, the difference in the amount of light secured was not startling as in the earlier revolution.

These two methods—gas and electric lighting—are still competitors, and both have their proper sphere of usefulness. In fact, where towns exist one or both of them will always be found, but in scattered districts and isolated buildings, except in cases where their size and the means of the transport permit of a complete electrical installation, there still remains the necessity for an easily-managed, self-contained form of lighting.

The relaxation of the Board of Trade regulations concerning the manufacture and storage of carbide of calcium produced acetylene gas from a scientific toy to a practical illuminant, but in the latest successful attempt to provide a satisfactory light it is remarkable that oil, so long discarded, should again be utilised, providing a gas in all essential respects equal to coal gas, with the advantage that it is obtained at small expense, in a simple manner from a plant which can be installed in the smallest dwelling-house or the best building, or can be distributed from a central plant to villages or small towns either for house or street lighting.

Many attempts have been made during the past few years to overcome the initial difficulties and objections to the use of oil gas as a lighting medium. In the "De Laitte" machine these have been solved by scientific knowledge aided by mechanical accuracy, as the following description will show.

The accompanying illustration shows a complete "De Laitte" gas plant, 2½ feet by 2½ feet by 4 feet high, driven

by a suspended weight, and supplying 30 lights. The gas is obtained by the evaporation of petrol admitted to the carburetter in small constant quantities to a much larger body of air, which by means of a drum is sucked in in the correct proportions, one gallon of petrol giving 800 to 1,000 cubic feet of gas. Owing to the high percentage of oxygen the gas has absolute combustion, free from carbonic oxide and sulphuretted hydrogen, and is therefore non-poisonous, and does not leave a deposit when burned to blacken

ceilings, picture-frames, &c., and above all, is not injurious to animal or plant life.

The gas produced in the carburetter is put under pressure by the drum and driven into the gasholder, which acts as a pressure regulator, and when full automatically causes the supply of petrol and making of gas to cease. Not only does it act thus, but so controls the supply that sufficient petrol only is admitted to make the amount of gas necessary for the number of burners in use, be they one or fifty. When no lights are required no gas is being

made, but when one is operated sufficient gas is formed and increases with each light required.

The gas is carried from the plant through ordinary gas-piping, and gives the best results when used in connection with incandescent mantles. The machine is automatic in working, and requires no skilled labour, it being necessary only to see that it is sufficiently charged with petrol, and the weight that operates the machine is wound up at regular intervals, regulated by the number of lights in use. In larger installations the power may be obtained by means of water, hot air, or electric motors.

One of the most important features of this system is the absence of any danger from explosion, as stated by Professor Vivian B. Lewes, F.I.C., F.C.S., in a lengthy report on the "De Laitte" machine, in which he also emphasises many other good points, showing its suitability for providing light for private houses and other buildings and places.

This system has already been adopted by the Midland Railway Company at Hathern station, the Caledonian Railway at Bishopston station, and is installed in a number of mansions throughout the United Kingdom, and judging by the testimonials received from the users is giving every satisfaction.

### ACCOMMODATION OF NAVVIES.

WHEN railways began, employment was obtainable by multitudes of men in the construction of cuttings or embankments. At first the labourers who had been engaged in the drainage of fens, reclamation of land and other works in Lincolnshire and Cambridgeshire met the demand, but as new lines were promoted men from most parts of the country were engaged. They were supposed to be paid liberal wages, but few people cared about the treatment they received, although the stories told about "tally shops," discounts, bills, &c., should have made the authorities less indifferent. It was taken as a matter of course that under such circumstances the navvies could not differ from cattle.

The report of Dr. Reginald Farrar to the Local Government Board on "The Accommodation of Navvies Engaged in the Construction of the Brooklands Motor-Racing Track" shows that the old neglect can prevail within a few miles of

the Metropolis. The number of men employed when Farrar visited the works was at least 1,600. There was provision whatever for the housing or accommodation of the men, and no shelters where they could resort in the weather. About 500 navvies travelled by train to the works but those who could not find beds in public-houses had to sleep in sheds, cow-houses, straw yards, or in the open air. It is needless to enlarge on the danger of such a state of things. What is perhaps of more importance is the prevention of similar evils in the future. According to Dr. Farrar:—

It is estimated that the navvies form in England, Scotland and Wales a nomadic class of 100,000 men, women and children. They move about from one piece of work to another, a distinct class or tribe; separated by habit and circumstances from the rest of the community, and in some respects often outside the action of ordinary sanitary laws. In 1846 a Select Committee of the House of Commons issued a Report on the Condition of Labour employed in the construction of Railways and other Public Works. This Report contained, among other recommendations, the following:—

"Your Committee is of opinion that, previous to the collection of a body of these workpeople at any spot, sufficient lodging for them should be ascertained to exist. When the neighbourhood cannot adequately supply it, the company should be required to provide it. Your Committee adverts with pleasure to the evidence they have received from gentlemen largely engaged in executing great public works, to show that comfortable arrangements for lodging the men are directly and indirectly amply remunerative for the additional expense they may at first entail."

It was also recommended:—"That the railway companies constructing any works should be required to make periodical returns to a public authority of various particulars embracing the most important points affecting the well-being of the men; these might comprehend the number of men, the progress of instruction, the cessation of labour on Sunday, the accidents and other details," and that work in progress should from time to time be officially inspected by a competent officer appointed by such authority.

Other suggestions of this committee dealt with the provision of constables, liability for accidents, regularity

ment of wages, regulation of "tommy-shops," provision of relief and medical attendance to the sick and mended, &c.

I am informed by the Secretary of the Board of Trade, except in so far as they are covered by the Truck Act and Employers' Liability Act, no legislative effect has been given to the recommendations of this committee. The Board of Trade have no jurisdiction over navvies and no control over railways until a line is complete and ready for section prior to being declared open for traffic.

An extract from Dr. Copeman's report on the sanitary circumstances of the Langport Rural District (No. 230) may be introduced here:—

"It seems just that companies, corporations and contractors who, for the purposes of their undertakings, bring large numbers of workmen to reside temporarily in a rural district, the resources of which, if adequate for the normal population, are not equal to deal with the influx, should provide housing accommodation for their workpeople and means of isolation in cases of infectious disease break-out among them—a danger to which these assemblages of people of nomadic habits are especially liable. In the Derwent Valley Water Act, 1899, a clause (section 64) requiring such provision to be made by the Water Board or by contractors, was inserted by Parliament on the instance of the Derbyshire County Council."

Apart from special local intervention of the kind to which Dr. Copeman alludes, there appears to be no legal obligation on contractors to provide accommodation for their workmen. When important works are in progress, they tend to last over a considerable time, and especially if the workmen are at a considerable distance from centres of population, the contractors generally, in their own interests and in order to secure workmen, provide accommodation, and this is often excellent (e.g. the Tidworth Settlement on Salisbury Plain); but I am informed that smaller contractors, who have tendered at "cutting prices," are apt to save in "hutting" and to provide inadequate accommodation or none at all.

One difficulty arises from the fact of "subbing." A contractor, after doing two or three days' work, draw a "sub" for the work done, and rest for a few days till the amount drawn has been expended (usually in

drink). Thus it not seldom happens that a contractor must have 100 men on his books in order to secure that 50 shall be always at work, and the housing difficulty is intensified. "Subbing" is necessary at the commencement of work, as many of the navvies will probably have tramped long distances to the work and arrive penniless, but the evil might be minimised if the contractors refused to "sub" after the first fortnight, and in any case refused to "sub" the full amount earned.

The Navy Mission, which was founded in 1877, has done excellent work in providing religious instruction and education for the class; and, as their efforts are cordially supported by many of the leading firms of contractors, the influence of the Society has doubtless operated in the direction of securing improved material conditions for navvies. I think it would be a good thing if the Board were to obtain some definite information on the subject of navy life in general, with a view to considering the question whether it is desirable to acquire legislative powers in respect of this class.

In the first instance I would suggest that any contractor employing more than a certain number of men on any works might be put under the obligation to inform beforehand the sanitary authority of the district concerned as to the commencement of such works and of their close. The sanitary authority should be under the obligation to notify the Local Government Board, and thus a current register of constructional works might be formed and kept up to date.

Such a register would facilitate inspection and supervision of these works, both by local sanitary authorities and from time to time by the central authority, and would thus tend to secure the provision of adequate accommodation for the workmen. It would also tend to prevent the spread of small-pox at times when the disease is prevalent. The Board have a considerable amount of evidence to show that small-pox outbreaks have on several occasions originated among navvies. Not only are these men, owing to their migratory habits, apt to carry infection from place to place, and in particular from one common lodging-house to another, but they are, as a class, specially averse to vaccination or re-vaccination, partly, no doubt, owing to the interference with work which the operation entails.

It appears to be the opinion of those who have studied the question from a general standpoint that some system of central supervision or inspection is desirable.

### SCOTTISH EXHIBITION, 1908.

THE buildings committee have recommended the acceptance of the tender by Mr. Alexander Calder, Edinburgh, for the erection of the industrial hall, subject to the satisfactory fulfilment of certain conditions. The hall will be constructed of wood and plaster with an iron and glass roof and the tender that has been provisionally accepted is less expensive than the architect's estimate. The original intention was that the industrial hall should be placed at the Balgreen Road entrance, but it has now been decided to place it at the west side of the quadrangle, where it will stand on more elevated ground, and consequently have a more dignified appearance. Another advantage in placing this great building at the west of the exhibition grounds is that it will there form a shelter from the prevailing winds, and thus shelter the bandstand and promenade area. Although the original design of the building has been somewhat altered, its general appearance will differ but slightly from the view exhibited in the Synod Hall after the competitive plans were judged.

The original plans showed the concert hall, with its large dome, in front of the industrial hall. The concert hall has now been separated from the industrial hall, and will be erected at the east end of the grounds, where it will be near the main entrance from Balgreen Road, and will thus be more convenient for people leaving the evening concerts than if retained near the industrial hall in the altered position of the latter. To compensate for the architectural feature that has been taken from the industrial hall by the separation of the two buildings, the architect has introduced two towers and a dome into the central design of the industrial hall. Each of the four sides of the building will be treated ornamentally. Some idea of its size may be given by stating that it is about half as large again as the industrial hall at the Dublin Exhibition. It will have a floor area of 100,000 square feet, while the area of the

industrial hall at the Dublin Exhibition is only 60,000 square feet. Notwithstanding the great size of the building, spaces for which applications have already been made occupy more than half of the total available area. Specifications for the machinery hall have been prepared, and executive will shortly advertise for tenders. They then take in hand the fine arts hall and after that concert hall.

### ARCHITECTURAL WOODWORK.

AMONG the works recently carried out by Messrs. Good Lamb & Heighway, Ltd., of Manchester, are the following:—New isolation hospital, Preston; head office Preston Savings Bank; complete fitting and furnishing of the Hotel de Ville, Leeds; the Royal London Friendly Society's new premises, Deansgate, Manchester; Pioneer Assurance Company's offices, Liverpool; Mersey Dock and Harbour Board new offices, Liverpool, complete furnishing, carpentry, &c. The following contracts are in hand:—Great Central Railway Company's new dining-rooms and refreshment-rooms at Sheffield station; the whole of the rooms in the Piccadilly Hotel basement, which contains grill-room and several of the large entertaining-rooms; whole of the ground-floor entrances, restaurants, &c.; whole of the first and second floors, which contain the best bedrooms, sitting-rooms and dining-rooms—contract includes, besides the interior joinery, fibrous plaster decorations, furnishing, electric-light fittings, &c. the whole of the joinery work for the winter garden at Waldorf Hotel; the whole of the parquetry work at Morning Post buildings; the interior fitting of Messrs. Vickers, Sons & Maxim's new offices, Sheffield (the whole of this work is being executed in mahogany, including the finishing to all the offices, corridors, &c. amounting to many thousands of pounds); Carnegie Library, Accrington, interior fittings; Carnegie Library, Eccles, interior fittings; new offices, Edinburgh; Assurance Company, Newcastle-on-Tyne; draperies and furnishing of the Empire Theatre, Sunderland, the King's Theatre, Southsea, and Empire Theatre, Birmingham.

## THE "SIGNET" Combined Range and Sitting - Room Grate

Very suitable for Small Houses, Country Cottages, Flats, &c. (Patented.)

Combines in itself in a practical and efficient manner the essential features of a Cooking Range and a Sitting-room Grate.

Many of these Grates are in use at Letchworth and Cleveleys Garden Cities and elsewhere. Harmonises with artistic surroundings and looks well in any room. Size 38x38 inches.

Supplied when desired with High-Pressure Boiler, also with artistic Cast-iron Chimney-piece. Goes into an ordinary fireplace like a Register, very little building being required. Well fitted and finished.

Has been THOROUGHLY TESTED and has given UNIVERSAL SATISFACTION. This Grate can only be supplied through Builders' Merchants, Ironmongers, &c. Copies of unsolicited testimonials and further particulars may be had from the Makers,

"CAT'S EYE" GLASS.

We have received samples of "Cat's Eye" glass, which is claimed to be a variation upon figured rolled glass, inasmuch as the arrangement of the lenses and discs is such that all the light received by the surface of the glass is concentrated in the discs, causing them to shine like cat's eyes—hence the name—while the portion of the glass between the discs remains dark. The result is certainly most effective, specially when placed in a half light, for the brilliancy of the "cat's eye" increases as the sheets are removed from the source of light. The makers claim that it is an obtuse ornamental glass which does not lessen the light, is brilliant by day and night, and shows a good design when viewed from either side. Further, that as all the surfaces are smooth, dust cannot collect on it.

TRADE NOTES.

MESSRS. JOHN H. FULLER & Co., LTD., of the Minster Mills, Reading, proprietors of the "Marpedo" paint, inform us that they have moved their London offices and depôt to 230 Pentonville Road, King's Cross.

MESSRS. ALTENBACH, LTD., of Brighouse, have commenced business as manufacturers of castings in malleable iron, steel alloy and special steels, claiming as a special feature to make mild steel castings for breakdowns within a very short time.

H.M. GOVERNMENT have given instructions to Messrs. Wm. Potts & Sons, Ltd., clock manufacturers, Leeds and Newcastle-on-Tyne, to erect a new illuminated chime clock at the Duke of York's schools, Dover. It is to be made generally on the lines of the late Lord Grimthorpe, with all the latest improvements inserted. The work is now well in hand and will be fixed at an early date.

MESSRS. HAHN & Co. have issued a specification of the important stock of foreign hard woods now lying at the Alexandra Wharf, close to Tidal Basin station, G.E.R. It comprises mahogany, wainscot oak, teak in logs, floorings, flitches, whitewood, sawn oak, kauri, Quebec birch, basswood, maple floorings, &c., which will be offered at lowest prices. Trains are frequent from Fenchurch Street.

MESSRS. GEORGE MILLS & Co., engineers, Radcliffe, near Manchester (proprietors of the "Titan" sprinkler) have received the following letter from Messrs. Robert MacLaren & Co., Eglinton Foundry, Port Eglinton, near Glasgow:—"As a few days ago a fire occurred in our pattern store, which was successfully extinguished by your automatic sprinkler, we have pleasure in enclosing you order for an extension to this service. Please have same put through without delay."

An article appears in this week's issue of *The Building Trade* describing the works and offices of the Zeta Wood Block Flooring Company, Ltd., of Stratford. Illustrations are given of the several departments of a wood-block flooring works. We gave some particulars of this firm in a recent issue. The result of less than three months' work is that the company have recently been compelled to work day and night shifts to cope with the demands made upon them.

We are informed that Mr. Joseph Hamblet has resigned his connection with Hamblet's Blue Brick Company, Ltd., of West Bromwich, with which firm he has been connected as proprietor, managing director and chairman for nearly forty years. The name of Joseph Hamblet has been so identified with the manufacture of blue bricks, for which he did so much to bring them to their present state of perfection, that we regret the severance of his connection with one of the most prominent firms. We have been asked to state that all personal communications should be addressed to him at Eagle Works, West Bromwich.

**FIRE PROTECTION.**

THE accompanying illustration shows one of the numerous fireproof doors that have been fixed at Messrs. Eastwood's Dying and Cleaning Works at Acton. At these works, covering over six acres, a fire broke out early in the present year practically destroying three buildings, and in

construction of these fireproof doors used their well-known hollow bricks, 1½-inch thick. As will be seen, the hangers are completely cased in with these blocks also, entirely protecting the iron from fire, and the doors when closed are the same way protected at both ends, where it is most needed.

re-erecting them every precaution has been taken to insure, in the event of a fresh outbreak, that the fire so far as is possible shall be confined to a limited area.

The Hempstead Patent Brick Company have in the

As the blocks used are guaranteed fire-resisting to the melting-point of steel these doors, with the special means adopted of casing the hangers, &c., should provide absolute protection.

# "Standard"

"Standard" Porcelain Enamel Ware is moderate in cost, beautiful in its finish and extremely durable. Absolute freedom from cracks or crevices assures the maximum sanitary protection. A bathroom fitted with "Standard" Ware greatly increases property value.

Write for our elaborate booklet, "MODERN BATHROOMS," also for our special lavatory booklet, showing many new patterns. Ask for Booklet No. 6, post free on application to Dept. F.

ELECTRIC NOTES.

THE electric-lighting committee of the Sheffield Corporation is proposing to spend 39,267*l.*—15,267*l.* on a 1,000 k.w. turbo generator plant at Neepsend and 24,000*l.* for electric cable.

AYR Town Council have agreed to apply for a provisional order for the extension of the Corporation tramway system from the north end of the New Bridge, by way of River Street, George Street and Whiteletts Road, to theburgh boundary at the new racecourse. The estimated cost of the proposed extension is 14,000*l.*

THE churchwardens of St. Gabriel's Church, Willesden Green, have requested the tramway company to reduce the speed of the cars past the church during service to eight miles an hour. They have offered to erect a semaphore signal, the arm being raised during service, if the company will instruct their drivers to observe its warnings.

THE Dudley Town, Council on Tuesday adopted the following resolution:—"That application be made to the Board of Trade for their sanction to the borrowing by the Council of a loan not exceeding 95,000*l.* for the purpose of the purchase of the tramways and light railways in the borough, to be borrowed on the credit of a mortgage of the general district rate of the borough."

MESSRS. GEORGE CRADDOCK & Co., Wakefield, have received a further order from the Glasgow District Subway Company for a specially made tramway cable. This rope is 36,300 feet long, 1½-inch diameter and weighs approximately 57 to 60 tons. This is the heaviest rope in the world.

THE Portsmouth Town Council are about to carry out extensions to the tramways costing 33,875*l.* 16*s.*, made up as follows:—For the line commencing at Fratton bridge and passing along Goldsmith Avenue to a point opposite the White House public-house, 14,407*l.*; from the point through Eastney Road to the Eastney terminus, 8,368*l.* 16*s.*; and from Highland Road through Festing Road to the existing tramways at the Canoe Lake, 11,100*l.*

THE Horsham Urban District Council give notice that they are prepared to receive applications for the free pupilage

offered by them at their electricity works. The pupilage will be tenable for two years, free of premium, and it is restricted to sons of ratepayers resident in the Horsham urban district since January 1, 1906. Candidates must be between 14½ and 17 years of age at the date of the qualifying examination.

THE Government of Ceylon having abolished the office of consulting electrical engineer, Mr. Francis B. Rylands, electrical works superintendent, has been appointed electrical engineer, in which office he will combine the duties he has been discharging with those performed by the late consulting electrical engineer. Mr. Rylands is the senior electrical engineer in Ceylon, and has been in the Government service for seven years, with charge of all electrical work except telegraphy.

TENDERS for providing the mains for the high-tension and low-tension systems in connection with the new electric station at Stannergate were submitted to the electricity committee of Dundee Town Council. Eight British firms have offered, and this part of the new installation will involve an expenditure of from 10,000*l.* to 12,000*l.* None of them in the matter of cost commended itself to the committee. It was felt that, having regard to the position of the copper market, and to the fact that its tendency is still downwards, an undue charge was being made. Accordingly it was resolved to take in fresh tenders, and in widening the field of selection to call for offers from foreign manufacturers.

THE work in connection with the instalment of the electric light at Dunrobin Castle, N.B., is now completed, and it will be largely used during the visit of H.R.H. the Duke and Duchess of Connaught. It has been found possible to retain the magnificent historical candelabra in the dining-room, drawing-room and main staircases. In place of wax candles electric lamps, an exact imitation of the shape and colour of a wax candle, have been fitted. In many of the other rooms the existing valuable fittings have been adapted and fitted with electric lamps. Electric fans for ventilating purposes have also been fitted, and now gas has been dispensed with for lighting, heating and ventilating purposes. The Duke of Portland has also recently had Langwell House on his Caithness estate similarly lighted and heated by electricity.

## VARIETIES.

THE Solihull Board of Guardians on Tuesday resolved on the erection of an administrative block at a cost of nearly 6,000*l*.

THE Hackney Board of Guardians have agreed to the erection of an additional pavilion at the workhouse infirmary at a cost not exceeding 21,050*l*.

THE Bremen Senate has assigned a sum of 400,000*l*. for the extension of the harbour and the improvement of the means of communication in Bremerhaven.

THE National Housing Reform Council have decided to give a prize of 2*l*. 2*s*. to the working man who sends in the best descriptive account of the Housing Exhibition at Wincobank, near Sheffield.

FOR building schools in Ireland the Education Commissioners in their report say that 40,000*l*. per annum is promised for this year and the two years following, while they ask 25,000*l*. a year additional from the development grant.

THE East Dereham Urban District Council have agreed that Mr. W. J. Dibdin, F.C.S., F.I.C., should be engaged at a fee of fifty guineas, to inspect the sewerage works and report as to the best means of carrying forward the works scheme.

STEEPLEJACKS who are at present repairing the chimney-stalk of the Caledonia Flour Mill, Montrose, discovered on the top a halfpenny of the date 1906. It is a good many years since any person was at the top of the chimney, and it is surmised that the coin, which was bent almost double, had been deposited there by a crow.

A NOTICE that no smoking would be permitted, and that disobedience of this order would mean instant dismissal, has brought out on strike 100 men employed at Springwell quarries, near Newcastle. They characterise the order as an unwarrantable interference with an old custom.

APPLICATIONS for membership for the next International Congress for Hygiene and Demography, which is to be held in Berlin from the 23rd to the 29th of the present month, now exceed 2,500. In order to make the necessary preparations intending visitors are advised to make application without delay.

THE Swansea Corporation housing committee have decided, with a view to expedite a scheme for the erection of dwellings on the Baptist Well estate of the Corporation which has been hanging fire owing to a difficulty as to the apportionment of the cost of providing main sewers and retaining walls, that an offer be made of 1*s*. per foot for the land, and a contribution of 500*l*. towards the cost of levelling, the Corporation to construct the main sewer.

THE Rugby Urban District Council have received a letter from the Local Government Board sanctioning the raising of a loan of 14,300*l*. for the construction of sewer disposal works in the parishes of Bilton and Newbold. The scheme is to be put in hand at once. It was said the scheme will be carried through at a comparatively small cost. The cost per head of the population would be only 1*s*., whereas the average cost of such schemes was 3*l*. per head.

THE thirty-second annual report of the Public Works Loan Board for the year 1906-7, states the Public Works Loan Commissioners made during the year 906 advances for sums amounting altogether to 2,123,496*l*., as compared with 1,030 advances for 2,266,305*l*. in the previous financial year. Of the total advanced 1,995,845*l*. was lent on security of local rates and 127,651*l*. on security of property. The average rate of interest receivable on the advances was 3*l*. 13*s*. 7*d*. per cent., as against 3*l*. 9*s*. 2*d*. in 1904-5. The advances included 29,166*l*. for the provision of working class dwellings.

AT the last meeting of Leith Parish Council it was reported, with regard to the defective flooring at the new poorhouse, that the architect had been instructed to call upon the contractors to lift all the upper floors in the main buildings and substitute proper material for the same. The architect was further instructed, in the event of the contractors failing to comply with this demand within three days from the date of the architect's letter, to at once proceed to take an estimate or estimates from other contractors for the carrying-out of this work.

THE health committee of the Liverpool City Council have under consideration the question "whether the powers under the existing Acts of Parliament and by-laws are sufficient to secure (a) health and cleanliness in dwelling sublet or otherwise, in courts and alleys in Liverpool; (b)

prevention of the building up of areas in the outskirts out due consideration to the proper planning of such areas; and, if not, what further powers the committee should be obtained." A new set of by-laws is in the process of preparation, and will be submitted within the next three months.

At the monthly meeting of Rothesay Harbour Trust—Major Burness presiding—approval was given to a scheme in connection with harbour alterations and improvements, involving an outlay of over 10,000*l*. The scheme submitted includes an extension of Albert Pier seaward, the construction of a new swing-bridge for the existing draw-bridge connecting the inner and outer harbours, and widening of Albert Place by 17 feet and the provision of a cargo wharf. It was also agreed that Mr. James Brodie, C.E., who acted as advisory engineer in connection with the alterations, should be appointed to superintend the work during construction.

MAJOR J. STEWART, R.E., inspector of the Local Government Board, held an inquiry at Chester respecting an application made by Chester Town Council for sanction to borrow 2,200*l*. for the provision of underground lavatories in the town hall square and at the junction of Bridge Street and Grosvenor Road; sums amounting to 6,000*l*. for the purchase of certain property required for the widening and improvement of Frodsham Street, Christleton Road and Grosvenor Lane, and also for the borrowing of 500*l*. with regard to the disposal of land in connection with the proposed widening of Goss Street and Hamilton Place.

A RETURN has been issued as a Parliamentary paper "of the medical officers of health and inspectors of nuisances in the rural districts of each county in England and Wales, showing the area and population of each district, and as regards each officer, the amount of his remuneration, whether payment is made in respect of it by the county council, and whether he holds any other appointment or carries on any other occupation." In the case of inspectors of nuisances there are 597 instances in which the officer has other appointments, such as surveyors of highways, building surveyor, &c., under his own or some other council, and 140 in which he follows some private occupation.

THE Holborn Board of Guardians have written the President of the Local Government Board asking permission to incur an expenditure—probably about 500*l*.—in making good the well-water supply at their schools at Mitcham. This supply, which was giving over 80,000 gallons per day, has fallen off and become cloudy, which experts say is due to the perishing of the pipes at the base of the bore. The well is 350 feet deep, and it will be found necessary to make another boring alongside that existing. The expenditure, however, is said to be justified, seeing that the water company's supply costs 6*d*. per 1,000 gallons, and the outlay in the pumping, &c., does not reach 3*d*. per 1,000 gallons.

THE Helensburgh Town Council have accepted the estimate of Messrs. A. Trail & Son, Helensburgh, for the building of new battery wall and the broadening of Row Road, in continuation of the present west esplanade. The cost will be between 4,000*l*. and 5,000*l*. There were a large number of offerers from different parts of the country. Messrs. Babbie & Brown, Glasgow, are the engineers of the scheme. Originally a scheme amounting to 16,000*l*. was approved by committee, but was rejected by the Council, and the present modified scheme adopted. The contractors have agreed to complete the whole works tendered for within eight months from the date of acceptance of their offer.

A LOCAL GOVERNMENT BOARD inquiry was opened at Berwick on Friday by Mr. A. G. Drury into an application by Berwick sanitary authority for power to borrow 20,000*l*. to meet the cost of a combined water scheme for the

J. & T. AVERY, Ltd., Soho Foundry, BIRMINGHAM.

borough. Under the scheme it is proposed to augment Berwick's present supply by means of a borehole, a large supply of excellent water having been found in the fell sandstone. The scheme includes a large storage reservoir, and would supply Berwick, Tweedmouth and Spittal, giving about 27 gallons per head per day. There is a strong local opposition to the proposal, and the witnesses examined in favour of the scheme were subjected to a severe cross-examination, considerable feeling being displayed at times. After sitting five hours Mr. Drury adjourned the inquiry till September 24.

THE Worcestershire County Council on Thursday considered a report upon the need of labourers' dwellings in the Evesham rural district, reference being made to the inquiry at Evesham in June. It was stated that there was a shortage of houses, which seemed likely to increase, and it had the result of driving young people into the town and of preventing the land being fully developed and other evils. As the law now stood the County Council could not in the first instance take any steps. The authority to put the Acts in force was the District Council, and they considered an opportunity should be given to the District Council to prepare a scheme. On their failing to produce an adequate scheme in a reasonable time they could, if necessary, report further on the matter. The report was adopted.

MR. BARNEWALL CROFTON, Local Government Board inspector, opened an inquiry on Monday at the North Dublin workhouse for the purpose of considering the propriety of confirming an improvement scheme of the Rural District Council. The scheme contemplates the compulsory purchase of land in the districts of Blandhardstown, Castleknock, Coolock, Santry, Howth and Raheny. The estimated cost of the first of the schemes for the acquisition of land is 3,740*l.*, and other incidental expenses make a total of 4,000*l.* It is proposed that the land shall be parcelled into seventy-eight allotments. Under the second schedule it is proposed to acquire compulsorily plots of land in the same districts, and the erection thereon of 209 cottages. The cost of acquiring the land was estimated at 16,200*l.*, the fencing 1,045*l.*, the building of the cottages 30,305*l.* and the expenses 1,236*l.*—total 48,786*l.*

THE Lord Mayor of London will preside on the 20th over an important conference, to be held at the Letchworth Garden City, for the purpose of discussing matters in connection with the Garden City movement and of making arrangements for propaganda work in various parts of the country. Several municipal authorities will be represented at the conference, and well-known experts will read papers dealing with the housing question. In October a further conference will be held in London under the auspices of the Garden City Association. The principal matter for consideration will be town planning. Many of the leading local authorities in the country have in this instance assented to the suggestion of being represented. This was the most important conference held in this country on town planning, and it is being convened because it was felt that the subject did not receive the attention it deserved at the International Conference held recently owing to the multiplicity of the matters discussed.

MR. R. J. PACK-BERESFORD, Local Government Board inspector, sat in the board-room of the workhouse at North Dublin to take evidence relating to the improvement scheme made by the Navan Rural Council under the Labourers' Dwellings Act. The clerk, Mr. C. Lacy, said there were 301 cottages in the scheme and the rents charged were 10*d.* to 1*s.* 1*d.* The total per year to the ratepayers on account of the scheme already promoted was 1,639*l.* 5*s.* 4*d.* The average annual loss on each cottage was 5*l.* 9*s.* The amount of the loss now applied for was 28,841*l.* 8*s.* It was proposed to add 102 additional plots. Mr. Anthony Scott, the Council architect, gave evidence as to the cost of the cottages, erection, 146*l.*; sites, 40*l.* an acre; legal, engineering and other costs, 14*l.* 12*s.*; total, 201*l.* 3*s.* The inspector of the Local Government Board wanted the estimate reduced to 180*l.* Mr. Scott said the estimate could be reduced to 180*l.* and still have four-roomed cottages, but he did not think the Council would consent to alter their plan for three-roomed cottages.

At a meeting of Shrewsbury Town Council on the 9th inst. a recommendation from the sanitary committee that the Council should adopt Part III. of the Housing of the Working Classes Act 1890, which authorises the acquisition of land for the erection of workmen's cottages,

to considerable discussion. The committee pointed out while desirous to support the medical officer of health, had reported that there were nearly 200 houses in the unfit for human habitation, they were unable to condemn them because of the absence of other dwellings into which the tenants might go. A suggestion that the Council should provide houses for the working classes at a rental which private people would not be prepared to do was met with the objection that it savoured of Socialism, and that it would be unfair to saddle the general body of ratepayers with the cost of providing houses for a section at less than market rents. Several members of the sanitary committee, who had taken a part in considering the question for several years, assured the Council of the gravity of the situation and of the shocking condition of many of the dwellings of the poor in Shrewsbury. The Council asked for fuller information, and when this was supplied, with the report of the medical officer, the recommendation was unanimously adopted.

R. H. J. DUNLAP, the United States Consul at Cologne, in his report on the condition of the manufacturing industries in the Rhine provinces continues to be most favourable. One of the points of travel any distance on any railway line in any direction that one does not see new factories being built. Additions made to those now in operation. Some of the new buildings are of great extent and seemingly indicate that the builders have great confidence in the future, and that all are erected in the most substantial manner, the material used being mostly cement, brick, and iron or steel. The new buildings are practically fireproof, where business contemplated permits of such construction. A general complaint is of the scarcity of labour and the difficulty to obtain any great increase from any place. It is said with certainty that no man in Germany is idle who does not so chooses.

The City of London Board of Guardians last week adopted the revised plans for the proposed new City workhouse and infirmary, the original scheme having been amended to meet certain suggestions made by the Local Government Board. The drawings of the imbecile block and the married couples' quarters were presented separately, in the sequence of a suggestion from Whitehall that their

erection should be deferred for the present. Provision has been made for constructing the open corridors of iron columns instead of brickwork, while the thickness of the walls has been materially reduced. "With regard to the construction of the floors, finishing of walls, sanitary fittings, joinery, &c." wrote the architect, Mr. A. E. Pridmore, "I am, and have been, paying due regard to the use of inexpensive materials and fittings." The chairman of the Board, Mr. J. B. Wild, stated that when the new building was finished there would be a saving of something like 5,000*l.* or 6,000*l.* a year to the ratepayers.

THE Glamorgan County Council roads and bridges committee at Cardiff last week considered several claims for damages, the result of recent accidents upon the Mumbles Road. The County Council had arranged with the Tarspra Company, Ltd., to spray two miles of the road with tar, and the accidents were stated to have occurred during the carrying-out of the work. The Tarspra Company sent in an account for 124*l.* for work done and repudiated any liability for damages. The clerk to the Council again expressed the opinion that under the contract the Tarspra Company were liable. Replying to a remark that the work was only done for the benefit of motorists, the Chairman said that the tarring of the road was purely experimental. It was further stated that the tarring of the road had done much to abate the dust nuisance, and was greatly appreciated by visitors and inhabitants. From the letters read it appeared that in several cases horses had slipped on the tarred road and people had been pitched out of vehicles. One correspondent threatened to report the matter to the Society for the Prevention of Cruelty to Animals. It was understood that the clerk would reply to the Tarspra Company repudiating the liability of the County Council.

THE Vice-President of the Department of Agriculture and Technical Instruction for Ireland has appointed a committee to inquire into and report upon certain matters relating to the improvement of forestry in Ireland. The committee consists of the following members:—Mr. T. P. Gill, secretary of the Department of Agriculture and Technical Instruction for Ireland (chairman), Lord Castle-town, Mr. William Redmond, M.P., Most Rev. Denis Kelly,

D.D., Bishop of Ross, Mr. Hugh de Fellenburg Montgomery, Mr. W. F. Bailey, Mr. William Rogers Fisher, M.A., and Professor John Rich Campbell. The terms of reference are:—To inquire into and report upon the following matters relating to the improvement of forestry in Ireland, viz. (1) The present provision for State aid to forestry in Ireland; (2) the means whereby, in connection with the operation of the Land Purchase Acts, existing woods may be preserved, and land suitable for forestry acquired for public purposes; and (3) the financial and other provisions necessary for a comprehensive scheme of afforestation in Ireland. The committee will commence its sittings in October. All communications intended for the committee should, for the present, be addressed to the Secretary of the committee at the offices of the department, 4 Upper Merrion Street, Dublin.

An inquiry was held at Stockport last week by Major J. Stewart, R.E., an inspector of the Local Government Board, into an application by the Stockport Corporation for sanction to borrow 7,090*l.* for the purchase of the Edgeley House estate. It was stated that the estate, which comprises ten acres, came into the market for building purposes, and a builder offered to buy five acres at 1,000*l.* an acre. The Corporation, however, desired to preserve the land for a park, and the owner had offered it to them for 7,000*l.* The estate was well timbered, and some beautiful old trees would be cut down if it got into the hands of builders. The district was rapidly being built up and close on 700 houses had been recently erected. It was originally proposed to build a public elementary school on one part. The owners of the adjoining land, however, objected to a school so close to residential property, and the education committee and the general purposes committee had not been able to agree as to a site. The general purposes committee therefore proposed that the whole of the estate should be laid out as pleasure-grounds. The Inspector said he did not think he should be able to persuade the Local Government Board to grant a loan in these circumstances. The Board would probably decide to wait to see what decision the Council came to. In his opinion Stockport was well supplied with recreation grounds and parks.

The British Consul-General, in his report on the commerce of Belgium for the year 1906 and the first half of

the present year, states that there has been an increase of 90,528 tons in the quantity of stone sent to France regard to the exports of cement, the total exports amounting to 813,329 tons, an increase of 133,903 tons on the 1905, which is largely accounted for by the augmentation of 55,864 tons in the exports to the United States of America. The value of the cement exports was 910,928*l.*, compared with 652,250*l.* in 1905—a very large increase for one year. It is perhaps from the point of view of the British cement manufacturer satisfactory to note that the exports of Belgian manufacture to the United Kingdom decreased in 1906 to 151,273 tons, valued at 169,426*l.*, the 1905 being 196,583 tons and 188,719*l.* The cement exports during 1906 was, notwithstanding this falling off, in a flourishing condition. The total sum raised by the customs duty on goods entering Belgium amounted in 1906 to 2,251,516*l.* The articles which produce the amount of revenue from the imposition of duty are: (1) Tobacco, the duty paid on which amounted to 20 per cent. of the total; and (2) wood for building purposes, duty 186,008*l.*, about 8.3 per cent.

A PROGRAMME has been issued in connection with the Conference of the National Association of Master Painters and Decorators of England and Wales, to be held in Liverpool from Monday, the 16th, to the 20th inst. In the evening of the 16th the president, Mr. G. H. Lloyd, will receive the members in the small concert-room, George's Hall, where the Conference meetings will be held. On the Tuesday the visitors will be welcomed by the Mayor, and the presidential address will be given by him, will be followed by the opening of an exhibition of the work of the apprentices' competition and an international student competition in drawings. The afternoon session will be devoted to the reports from the secretary, treasurer, and committees, education committee and the trade scholarship competition. Greetings from the Association of Master Painters in Scotland and Ireland will be given by the respective presidents, Mr. Robt. L. Anderson and Mr. Macnamara. In the evening there will be a reception by the Lord Mayor and Lady Mayoress at the town hall. The second day will be spent in addresses and discussions.

### MONOLITHIC BRICKWORK.

An interesting and impartial series of tests concerning the effect of the reinforcing of the mortar joints of brickwork has been conducted by Mr. W. H. Brown, architect, York. They were less elaborate perhaps than some others that have been announced. Yet on that account they have special importance because they refer to ordinary work; and we might say that similar experiments could be made without extraordinary expense. For reinforcement hoop-iron was first employed. But as it appeared to act independently it did not serve Mr. Brown's purpose. Simple wire netting proved to be preferable, and it sustained very remarkable tests. It would not be fair to Mr. Brown to describe the results without the aid of the photographs which are in his brochure. He ascertained that brickwork with such simple reinforcement as was afforded by wire netting laid in the mortar joints, resisted compression and tension to an unanticipated extent.

### NEW CATALOGUE.

The sanitary specialties of Mr. W. E. Farrer, of Birmingham, show a desire to strike out new lines, and that not only in the manner of working but in their appearance. He is saying much for a volume which contains over 200 illustrated pages. Mr. Farrer's specialties are not confined to those required in private houses, schools, hospitals and

other places for indoor use. He has also succeeded in producing ingenious automatic sewage distributors for filter beds. The latter have, moreover, the advantage of not appearing unsightly, and the analytical tests by official chemists show that they have fully answered the purposes for which they were designed.

### AN ABERDEEN MANSION.

The renovation of a somewhat celebrated old building in Aberdeen has brought to light some interesting examples of decorative art at the end of the seventeenth century. The building referred to stands in the Guestrow—one of the slum districts of the city—and was erected about 1676, although a portion of it dates back to 1580. During the Jacobite rebellion of 1745 the house was lent by its then owner to the Duke of Cumberland, who occupied it as his residence during his six weeks' stay in the city, and not only made very free with all it contained, but on his departure carried off all the valuables he could possess himself of. Since that date the house has changed hands many times, and latterly has been used as a common lodging-house—a purpose to which it was well adapted as it contained numerous rooms. It was in a small panelled apartment—probably an ante-chamber—that the discovery referred to was made. Ordinarily one would have expected that the panels themselves would have been the portions decorated with subjects, but it is not so in this case. The panels have been painted very boldly with an effective imitation of marble, and the stiles and rails enclosing the panels have been carefully and minutely treated with painted decoration on a black ground. The decorations include groups of figures, landscapes with trees and with towers, spires, castles and ruins. The work has been done with great skill and is evidently by a thorough craftsman. A feature of it is the brilliance of the colouring, which in some portions is probably as perfect as on the day when it was applied. To all appearance the painting is contemporaneous with the date of the erection of the house, so that it is probably about 230 years old. The whole decoration of the room is an extremely interesting example of the decoration of the period, which appears to have been largely influenced by the art of the Low Countries; and it displays

the high ability and cultivation of the craftsmen of the time. The ceiling of a small apartment in the older part of the house is painted in the Flemish manner. This apartment was probably used as a private chapel. An extraordinary amount of interest has been taken in these discoveries, and for some time past the house has been visited on an average by between two and three hundred people daily.

### LEICESTERSHIRE SCHOOLS.

THE following remarks by the Director of Education for Leicestershire are put as a "Prefatory Memorandum" to the latest Report on Public Elementary School Accommodation in the county:—

On the evidence of the former "Report on Public Elementary School Accommodation" of January 21, 1904, and of the subsequent public inquiries held by the buildings and sites committee during the early months of the same year, it was estimated that the minimum number of school places immediately to be provided by the county council was 3,775, and that the number which it then appeared probable would be provided by voluntary school managers was 1,310. It was, however, remarked in the report that this by no means exhausted the number of school places which might have to be provided in the early future by the county council.

Unforeseen developments and changes of policy have necessarily affected largely the original proposals, especially in regard to projected building and extension of voluntary schools. And further, the resolution to exclude infant scholars under the age of five years in rural districts helped to relieve the overcrowding in many schools.

Apart from the provision of additional accommodation, a considerable sum of money has been expended for the improvement of existing accommodation, both by the committee and by the managers of voluntary schools.

In the present report, particulars are given of the actual number of additional school places provided by the education committee and by voluntary school managers during the past three years. Some attempt has also been made to estimate the future requirements in regard to school accommodation in a form similar to that of the previous report referred to above. This has necessitated a general review

of the whole of the schools in the county, with special reference not merely to any deficiency of accommodation but also to defects of structure.

On the understanding that the policy of the committee is to effect gradually, but continuously, an improvement in the general character of school buildings, several buildings are "blacklisted" in the report, which, though not notoriously inadequate, cannot be regarded as attaining a satisfactory standard of efficiency. Consequently, the present report regards elementary school buildings from a high standard, and goes somewhat more deeply into the question of inadequacy or of structural deficiency than the former report of 1904.

In this connection special attention is directed to Part Section IV., of the report. In this section some attempt has been made to summarise the requirements of school accommodation in the immediate future, and to indicate the relative gravity of cases of deficiency.

In accordance with circular letter El. Ed. 74 the managers of schools have now been supplied with a full and detailed record of repairs and structural alterations which will be necessary during the year 1907-8 in order to satisfy the requirements of the Board of Education and of the committee. Managers have also been at the same time informed as to the more substantial items of damage due to fair wear and tear for which the committee may accept responsibility under section 7 (1) (d) of the 1902 Act, and which, it is suggested, shall be made good during the next summer holidays, and managers have been requested to submit any observations thereon.

Consequently in Part II., Section II., under the heading "Particulars of schools deficient or inefficient in accommodation," only those schools are included which appear to demand special attention from the committee. Minor defects intimated to the managers as above are not recorded in this section.

As in my former report of 1904, I would again urge that a nominal accommodation on the basis of 8 square feet per scholar does not insure any degree of efficiency. Even where the accommodation is nominally adequate on this lower basis, or yet on the higher basis of 10 square feet, the planning and internal arrangements of the schools (as ill-shaped rooms and deficient corridor and cloak-rooms)

space) frequently render it quite inadequate for the number of children habitually attending. In other words, the low official standards for floor space adopted in England leave little or no margin for comfortable working and render it extremely difficult to give in figures any true indication of the needs of a school as to accommodation.

In any case, a school building in which from 100 to 200 children are nominally accommodated, on an 8 square feet basis, in one large room without partitions or any means of deadening the dreadful babel of sound, should be severely condemned from the point of view of educational economy. The use of such a building for school purposes involves an enormous waste of ratepayers' money.

Another cause of delusion is the estimation of the efficiency of a school building by reference merely to the average attendance of the children. In many a school, which appears to provide sufficient accommodation when tested by a year's average attendance, efficient teaching is impossible during six months of the year owing to overcrowding. The accommodation of a school may be regarded as sufficient only when there is floor-space, at least approximately, for the highest number, and not merely for the average number, of scholars attending during the year. Generally speaking, for the purpose of the present report a standard of attendance somewhat more exacting than the average standard has been accepted as the basis of calculation.

Accordingly, in regard to the deficient schools scheduled Part II., Section II., the following information is supplied:—(a) Nominal accommodation; (b) the number of scholars on the register during that period of the year when the school reaches its full complement.

The nominal accommodation is that recorded in the Board of Education List of Public Elementary Schools on January 1, 1906. On October 31, 1906, managers of schools were requested to submit any observations as to errors or possible errors occurring in this official list; and many instances of important information has been received supplementary to that contained in the Blue-book. Where information may affect the official estimate of accommodation, attention is called to the same in a footnote.

The number of scholars on the register during that period of the year when the school reaches its full complement

(by which it is suggested that, approximately at least, the actual accommodation of the school should be measured) is in accordance with the school attendance returns for the past twelve months.

The committee will understand that any suggestions contained in the present report, as in the report of 1904, are based entirely upon such information as comes strictly within the purview of their educational adviser. In the ultimate solution of the various problems the committee will be assisted by that special local knowledge which will be placed at their disposal by the representatives of each of the districts concerned.

I take this opportunity of acknowledging the expert assistance received in the preparation of the report from Mr. E. G. Fowler, clerk of school buildings.

## TRAPPING AND VENTILATION OF SEWERS.

At the meeting of the Sanitary Association of Scotland in Aberdeen, Mr. Gilbert Thomson, C.E., Glasgow, read a paper on the subject of "The Trapping and Ventilation of Drains and Sewers." The question was by no means new to the Association. It was of great importance as bearing upon health, and large financial questions were involved. It was complicated by the fact that what was really one problem was artificially divided into two parts, the local authority being responsible for the sewers while the individual was responsible for the drains, but the latter was controlled by the former under minute regulations. In fact, the proprietor had little option in deciding upon the work; his function was to pay the bill. The local authority even had not altogether a free hand. Acts of Parliament which, in the nature of things, could not be up to date, were fairly specific in their requirements. He did not know if they were always obeyed, but at all events they could be presented like a pistol at the head of any objector. Who, for example, could hesitate to trap and re-trap his drains when he read, as one Act had it, "All sewers and drains, whether public or private, shall be trapped and ventilated by the Commissioners or the persons to whom they severally belong"? (Burgh

Police [Scotland] Act, 1892, section 229.) Whether this meant that all sewers were to be trapped and all drains ventilated, or that both were to be trapped and both ventilated, did not clearly appear; one meaning which did not seem natural was that sewers were to be only ventilated, and drains both trapped and ventilated; but this was what was usually done. He did not profess to be an expert in bacteriology, and therefore spoke subject to correction when he said that the effect of bad drains in causing illness was probably not so much due to the gases which escaped into the house as to the foul liquid which escaped and saturated the surrounding soil, thereby providing an excellent breeding-ground for untold multitudes of germs. There was at least no doubt that the old idea about the danger due to an accidental whiff of sewer air, or the complete explanation of an outbreak of illness when a crack was discovered in a pipe, was exaggerated, otherwise their system of sewer ventilation would be utterly indefensible. As it was, they were not very consistent. There were other inconveniences in the usual system of trapping and ventilation in addition to the difficulty of ventilating the sewer. First among these was the liability of traps to choke. By abandoning the main disconnecting trap, they would at one stroke solve the problem of sewer ventilation. The alternative to the system of traps was simply tight pipes.

There was a feeling that our elaborate precautions, if they erred at all, did so on the side of safety. With this he did not agree. The present system of building regulations, while of service in preventing very bad work, had actually the effect of encouraging mediocre work, and directly discouraging the highest class of work. The work with which sanitary authorities had perforce to be content, compared with that which sanitary inspectors would like to get, and which he and others insisted on getting, differed as night from day; and, further, if freed from hampering by-laws and consequent complications, the better work would in many cases be the cheaper. He would therefore submit to the Congress that, while the present system of trapping and ventilating sewers and drains was suitable for former conditions, these conditions no longer existed, and the time had now come when disconnecting traps on either drain or waste pipes need not, in the case of pipes properly constructed and effectively tested, be compul-

sory. Anyone building a house should have the option of complying with the present regulations, and passing present haphazard tests, or of passing a stringent test, simplifying his work. He was perfectly satisfied that the latter would be safer, and as it would usually be cheaper it would before long be the course naturally adopted; and the present regulations might join pan-closets, street ventilating gratings, smoke testing and "D" traps in so museum of sanitary antiquities.

Mr. John P. Lawrie, sanitary inspector, Bo'ness, did not see what harm the poor old trap had done. The doctor did not cure them—he gave them the sense of security. He did the trap.

Dr. Matthew Hay, Aberdeen, had long been impressed with the force of the views put forward by Mr. Thomson with regard to drainage. He mentioned difficulties of a practical kind, and suggested precautions that should be taken in connection with the present system. He agreed with Mr. Thomson that it would be a very desirable thing to get the main sewers better ventilated than they were. The sewers in our large towns were very far from perfect. Though people feared microbes nowadays, they must be in mind that these odours had a bad and depressing effect, and had been the means of bringing about typhoid or tubercle and making people susceptible to disease.

#### A SUBTERRANEAN LIBRARY.

THE Carnegie library scheme, as applicable to Dundee, is developing to a conclusion. The branch libraries are being constructed, and now, seven years after the gift was made, plans have been prepared for the erection of the central reading-rooms. For this purpose a sum of 11,000 was ear-marked from the Carnegie gift. The cause of the delay, in the main, has been the lack of a suitable site. To secure such was only possible at an expenditure beyond the limits of the public purse. The private benevolence which was expected to be exercised for the purpose was not forthcoming, and accordingly the ingenuity of the committee and of the city architect, Mr. Jas. Thomson, has been severely taxed to find a way out of the difficulty. Mr. Thomson, says the *Dundee Advertiser*, has evolved a plan

which, because of its boldness of conception and the skill with which natural difficulties are surmounted, is noteworthy to a degree. It was felt that, *ceteris paribus*, an extension of the Albert Institute was the line of natural development, but investigations, thorough and prolonged, showed that in the ordinary way such was impossible without cramping the grounds and marring the architectural features of the building. Accordingly, as stated, the city architect has been led to the unusual course of building below ground. At a meeting of a joint-committee of the free library committee and of the Town Council last week plans were submitted.

Mr. Thomson stated that he had carefully considered the matter to report as to what provision could be made for the extension or enlargement of the central library within the grounds of the Albert Institute, and had fully investigated as to the advantages and disadvantages of several methods of providing the required accommodation. He had prepared plans of several schemes, but it would probably be sufficient if the committee considered such of these as at first sight might be regarded as reasonable and feasible proposals. In every instance the light, utility and amenity of the existing buildings were injuriously affected, but the unavoidable and most serious objection was that all three schemes involved the building over a part of the existing open space. This objection was of itself fatal, and he was sure that any attempt to encroach on the open space would be received with disfavour, and would not be tolerated by the community. It naturally fell to be considered whether the additions could be provided within the grounds of the Institute by placing the accommodation underground and avoiding all the objections which are attendant to the other schemes. He had fully and carefully considered this alternative, and had prepared sketch plans of an underground scheme. They show the accommodation placed on the north side of the Institute buildings to the west of the Queen's statue, approached by an entrance porch on the north side of the present main staircase, this staircase continued down to the level of the new floor, and connected with a spacious octagonal entrance hall, from which are entered the main reading-room, 77 feet by 33 feet, and ladies' reading-room, 33 feet by 33 feet, special provision being made for the

accommodation of newspaper readers off the main reading-room. The plans provide for 184 feet of reading tables for men, 100 feet for ladies and 285 feet of newspaper stands, as compared with the present accommodation of 80 feet for men, 30 feet for ladies and 65 feet of newspaper stands. The effect of the top lights of the reading-room, as seen from the adjoining streets and grounds, has also been considered, and the roof so designed that the surface might be laid out as at present with turf and flower beds. In the suggestion of underground rooms, the city architect added, questions immediately arise in most minds as to probable damp, insufficient light and inefficient ventilation; but on investigation and by the application of up-to-date methods of construction these supposed difficulties are found to be imaginary. The placing of rooms underground is no new departure in design, more especially where ground is valuable or is necessary as open space, and there are many examples of excellent accommodation having been provided underground where circumstances demanded. In the present instance, he said, there is no practical difficulty in providing the required accommodation underground, and he had no hesitation in recommending that the new reading-rooms be so provided. He had not made his recommendation without giving the matter the fullest and most earnest consideration, keeping specially in view the provision of spacious, well-lighted, efficiently-ventilated and conveniently-situated reading-rooms, so designed as to admit of the greatest economy in management, without injury to the amenity of the Albert Institute buildings, and without building over any part of the Institute grounds, an action which would, he was satisfied, be an irretrievable blunder.

Internally the reading-rooms will be finished in faience and the floors will be laid with indiarubber tiles. The height of the ceiling will be 17 feet. As indicated, there will be little disturbance of the grounds. The roof lights or lanterns will be within the present enclosures, masked by flower-beds.

In the course of discussion the committee expressed its appreciation of the artistic design of the rooms, and its commendation of a bold and original idea skilfully worked out. The committee unanimously approved of the plans, and decided to recommend the Town Council accordingly.

## LONDON COUNTY COUNCIL EVENING SCHOOLS.

THE London County Council desires to call attention to the facilities offered for evening instruction in the various institutions maintained by it or under its control. In the various polytechnics, technical institutes and schools of art situated in the county, classes in science, art and technology, music, artistic handicrafts, &c., will be reopened towards the end of the present month. These institutions provide instruction of an advanced or technical character. Every facility is offered to different types of students to supplement workshop, office or studio practice by evening study under the most favourable conditions. Courses are arranged, where necessary, to prepare professional students for various examinations, art students for the examination of the Board of Education, and artisans for the examinations of the City and Guilds of London Institute, &c. The Council offers annually scholarships and exhibitions to the total value of 1,500*l.* for competition among students of polytechnics, technical institutes and art schools. The great success which has in the past attended the classes held at the Council's institutes and schools of art has made it necessary in several cases to provide for additional meetings of such classes to accommodate the increased number of students, and it is also proposed, provided the necessary number of students be forthcoming, to open certain new classes for which frequent application has been made.

The fees vary from 4*s.* 6*d.* to 10*s.* a session. In many subjects apprentices, learners and improvers are admitted free.

In thirty-six London County Council schools centres for instruction in commercial and science and art subjects will be opened. These centres are in a degree contributory to the polytechnics and technical institutes mentioned above, and are primarily intended for students not sufficiently advanced for the polytechnic classes. Advanced work, however, is taken in many of the subjects. The instruction given in these centres includes commercial subjects such as accountancy, banking and currency, commercial law, book-keeping, commercial correspondence, shorthand, typewriting and modern languages, science subjects such as physiology,

geology, mathematics, chemistry, hygiene, building and machine construction; and art subjects such as drawing in light and shade, model, freehand and geometrical drawing, memory drawing of plant-form and common objects. The fees vary from 1*s.* 6*d.* to 5*s.* the session for one or more subjects, according to the age of the student and the character of the subjects taken.

In 237 London County Council school buildings situated in every part of London ordinary evening schools will be opened this session. The instruction will, as a rule, be of a character preparatory to that given in the centres, and will embrace commercial subjects such as book-keeping, shorthand and modern languages, and general subjects such as arithmetic, geography, history and composition. Women and girls will be able to receive lessons in practical cookery, dressmaking, millinery, needlework and laundry work, and instruction in woodwork will be provided for men and boys. Gymnastics will be taught, and lectures by doctors and nurses on first aid, home nursing, health and infant care will be given.

There are eleven special schools which provide suitable instruction for the deaf.

In fifty-eight schools situated in poor districts no fee will be charged to any students, but as a rule a charge of one shilling for the session for one or more subjects will be made in the remainder of the schools.

A special effort is being made by the Council to encourage the study of English literature. Special lecturers have been engaged to deliver courses on the literature of various periods in twenty-four commercial centres and six secondary schools, &c.; in the latter the lectures will be of a more advanced type.

The polytechnics and technical institutes will be open, as a rule, during the week commencing September 23. The centres and the ordinary evening schools will be open for the enrolment of students in the week commencing Monday, September 16.

Any persons who desire further information concerning these institutions should apply to the schoolkeeper of any one of the Council's schools for a handbill giving particulars of the various institutions in the district. Full details are given in the prospectus of each institution, a copy of which may be obtained free on application at the institution.

## EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

## TENDERS, ETC.

\* \* \* As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

## COMPETITIONS OPEN.

BOOTLE (LANCS).—Jan. 31.—The Bootle education committee invite designs for a public elementary school for 1,000 children. Conditions and particulars may be obtained from Mr. J. Henry Farmer, town clerk, Town Hall, Bootle.

CEMAES.—Oct. 15.—The Twrc-lyn Rural District Council invite plans and specifications for a drainage scheme for the village of Cemaes, Anglesey. Competitors are requested to state the remuneration required by them for the plans, specifications and supervision of the work. Mr. Thomas Hughes, clerk, Brynaethwy, Menai Bridge.

DOVER.—Oct. 14.—The committee of the Dover pageant, July 27 to August 1, 1908, invite coloured designs for a suitable double-royal poster (40 inches by 25 inches). There should be some indication of the sea, a ship and Dover as the key of England. Prizes of 10l., 2l. 10s. and 1l. are offered. The prize-winning designs will become the absolute property of the committee. The Secretary, Pageant House, Dover.

LONDON.—Oct. 14.—The Acton District Council invite architects who have been in practice for at least seven years to send in to Mr. Wm. Hodson, clerk, 242 High Street, Acton, W., before Oct. 14, designs for erection of the proposed Council offices, at a cost not exceeding 18,000l. An assessor will be appointed, and premiums of 100 guineas, 50 guineas and 25 guineas will be awarded for the designs selected by the Council after their consideration of the assessor's award. Particulars can be obtained upon the payment of 10s. 6d.

## CONTRACTS OPEN.

IN a reference to the Thames barrage scheme, Dr. Williams, the medical officer for the port, remarks that, unless measures are adopted to divert the sewage outfall, there will be a big stagnant sewer in the middle of London if the project is carried out.

THE Home Secretary has appointed a committee to inquire and report what would be the best means of securing to persons employed in lime and cement works and chalk quarries, who are paid by weight or by measurement, the means of ascertaining the correctness of the wages they receive. The committee is constituted as follows:—Mr. Ernest F. G. Hatch (chairman), Mr. J. N. Bell (of the National Amalgamated Union of Labour), Mr. Alfred Brooks (Associated Portland Cement Manufacturers), Mr. J. E. Harston (one of His Majesty's Inspectors of Factories), and Mr. Lloyd Morgan, K.C., M.P. Correspondence may be addressed to the secretary, Mr. A. Maxwell, of the Home Office.

## TRADE NOTES.

THE Bowes Museum, Barnard Castle, is being ventilated by means of Shorland's patent exhaust roof ventilators, the same being supplied by Messrs. E. H. Shorland & Brother, of Manchester.

UNDER the direction of Mr. W. L. Mason, F.R.I.B.A., architect, Ambleside, the "Boyle" natural system of ventilation, embracing the latest patent "air-pump" ventilators, has been applied to the Wesleyan school, Ambleside.

MESSRS. SAMPSON LOW, MARSTON & CO., LTD., are about to publish "Owen's Slate and Tile Tables," which will show at a glance the equivalent price per square, or per square yard, to any given price per 1,200 slates in all sizes.

MESSRS. T. T. SMITH & CO., Leicester, are executing the heating apparatus in connection with the new wing No. 2 north pavilion of the workhouse, Gravelly Hill, for the Aston Board of Guardians; and the heating apparatus and domestic supply for the new café and tea-rooms, Market Street, Leicester.

It will be seen from an advertisement on another page that the rights under the patent for the manufacture of the "Ideal Window" in England are for sale. In Germany the window has found unusual approval, and judging from the drawings it has features which are both novel and convenient. A specimen window will soon be exhibited in London.

MESSRS. NORTON & GREGORY, not satisfied with their varied and extensive practice, have acquired the business hitherto carried on by the Architects and Engineers' Supply Association, 4 and 5 Dean Street, High Holborn, W.C.,

which is now transferred to Castle Lane, Buckingham Gate, S.W. Messrs. Norton & Gregory will continue to stock the identical goods.

THE Coatstone Decoration Company, of 77 Mortimer Street, W., have secured the contracts for coating the walls with coatstone of palm-court, grille-room, corridors and staircases at the Waldorf Hotel, and corridors and staircases at the Piccadilly Hotel. The material gives an excellent imitation and cannot be detected from the natural stone with its masons' joints and blocked out in courses. We think when this material is better known it will be more extensively used in the future, both for interior and exterior work.

MESSRS. CHURCHILL & SIM, in their circular for September, state that August has been a month of crisis for the wood trade, consequent on the heavy reductions in selling prices, made in the first instance by Swedish shippers from the Upper Gulf and followed more or less by all Swedish, Russian and Finnish exporters. These reductions having somewhat exceeded the bounds of reason and necessity have fallen severely on importers in this country. Nevertheless a very large business has been effected, country markets having shown a great capacity for large purchases at the lower rates, and having been followed, though to a lesser extent, by London. In the meantime, owing to the minute importation, aided by an increase of some 1,700 standards in the dock deliveries, in comparison with those for August last year, a beneficial change has taken place in the figures of the London dock stocks.

## CORRESPONDENCE.

## Fire Protection.

SIR,—Referring to a notice of fire-resisting doors in your issue of September 13, page 14, we are sorry our name has been given to you wrong, and also an unfortunate error has been made in spelling the word "dying" instead of "dyeing."—Yours faithfully,  
EASTMAN & SON.

## VARIETIES.

THE Society of Architects on Saturday the 21st pay a visit to Letchworth (Garden City), and will inspect the estate with its houses, factories, exhibition cottages, &c.

THE Leigh Town Council have rejected a proposal to make the minimum wage of Corporation employes 25s. a week, but decided to increase the wages of scavengers from *d.* to 5*d.* an hour from April 1 next.

THE accounts of the Bath Corporation's electrical undertaking for the year ended March 1907 have been published. The year completes ten years of municipal control, and the result is a deficit of 1,440*l.*, although the capital expenditure stands at 162,000*l.*

A BOARD OF TRADE memorandum on the state of skilled labour in August states that employment during the month showed on the whole some decline as compared with July. On the other hand, there was slight improvement in the building trades as compared with a year ago.

THE President of the Local Government Board has authorised, under the grant voted by Parliament in aid of scientific investigation concerning the causes and processes of disease, a bacteriological investigation by Dr. F. W. Andrews of the air of sewers and drains.

LAST year there was a slight decrease in the number of new houses built in Sheffield. The total was 1,892, as compared with 2,010 in the previous year and 2,117 in the year before that. The biggest building year was in 1900, when 2,722 houses were erected.

AMONG the attractions of *Harper's Magazine* for this month is an article on "A Country under Two Kings," by Robert Shackleton, and another one on "Saracenesco, the Home of Models," by Grace Ellery Channing. The numerous illustrations throughout are of the usual high class.

At a meeting of the Cannock District Council plans for a proposed sewerage scheme for Cheslyn Hay, costing 600*l.*, were approved. As the parish council had requested that the sewer connections should be made to the boundaries of properties at the expense of the Council, a further sum 400*l.* was added to the intended loan.

At a meeting of the plans committee of the Aberdeen Town Council on the 12th inst., plans were submitted

representing property to the value of 10,250*l.* The plans passed during the past fortnight represent a total value of almost 18,000*l.* for the month. This may be taken as an indication of a slight improvement in the building trade.

THE Tamworth Rural District Council on Saturday resolved to apply to the Public Works Loan Board for a loan of 28,920*l.* at 3½ per cent., to be repaid by sixty half-yearly instalments of principal and interest, for the sewerage and sewage disposal scheme, and for a further 1,600*l.* at 3½ per cent., repayable by thirty half-yearly instalments of principal and interest, in respect of machinery.

THE Dunfermline Town Council have adopted the plans presented by the Corporation gas committee for a proposed building for improved sulphate of ammonia plant and housing for same, with workmen's room and lavatory attached. The engineer stated the probable cost of the building, fittings and plant, &c., to be 900*l.*

THE market committee of the Belfast Corporation has passed a resolution recommending the Council to instruct the finance committee to borrow the money necessary for the erection of the new abattoir already approved by the Council, and for which a loan of 30,000*l.* was sanctioned by the Local Government Board in 1899.

THE Urban District Council of Portrush invite tenders by November 2 for a thorough and complete lighting installation by means of either electricity or gas, and for this purpose have had specifications prepared by Mr. John Woodside, A.M.I.E.E., Ocean Buildings, Belfast, copies of which can be seen at the office of the Council, Town Hall, Portrush.

ACTING upon instructions from the Southend-on-Sea Council, Mr. E. J. Elford, the borough engineer, has prepared a scheme for the enlargement of the pierhead extension of the tramway and increasing the berthing accommodation. It is estimated that the scheme will involve an outlay of 73,000*l.*

A CHIMNEYJACK was charged at St. Helens police-court on Monday with causing his three children—aged five, seven and fifteen—to take part in a dangerous performance by climbing a chimney 110 feet high at Roughdales brickworks. Defendant, who claimed that the children were the cham-

# Burmantofts' Terra-Cotta

## Burmantofts' Terra-Cotta

is proof against the deleterious atmospheric conditions of many of our large towns which so frequently ruin stonework and other facing materials. Burmantofts' Terra-Cotta is strongly recommended for Facades of Public and other buildings.

## The Fire-Resisting Powers

of Burmantofts' Terra-Cotta are greater than those of any other known building material. It has been conclusively proved that steel, iron, and other material properly encased in Terra-Cotta have withstood the greatest heats.

## For Steel and Concrete Constructions

Burmantofts' Terra-Cotta is unequalled. It can be jointed and prepared to suit its position, thus saving considerable time, trouble, and expense.

# THE LEEDS FIRECLAY COMPANY, LIMITED,

HULL.

pion juvenile steeplejacks, said they had to be trained from early childhood. He was ordered to pay costs and was bound over.

THE Chester District Council were informed at their last meeting that the tender of Messrs. Jowett Brothers, contractors, Burscough, Lancashire, at 13,336*l.* had been accepted for carrying out the Upton, Bache and Newton sewerage scheme, and that they had already established works and made some little progress with the sewerage of Upton Heath.

At a conference held on the 13th inst. in Aberdeen between representatives of the settmakers and the quarrymasters regarding the reduction intimated by the latter in the making price of setts, the masters, with a view to corroboration, agreed to make a modification of 3*d.* per ton on one size of setts, namely, those of 3 inches by 6 inches. The reduction will thus be 1*s.* in place of 1*s.* 3*d.* The result of the conference was that, with this exception, the other reductions proposed are to stand.

THE North Walsham and Dilham Canal, nine miles in length, which runs from the river Ant, near Wayford Bridge, at Stalham and Smallburgh, through about fourteen parishes to Antingham Basin, in Norfolk, has been offered for sale by auction in London. The undertaking consists of the freehold of the greater part and the leasehold interest in the remaining part of the waterway, and its trade income is said to be close upon 400*l.* per annum. The property was knocked down for 2,550*l.*

THE final payment of compensation for damage inflicted by the recent explosion at Woolwich Arsenal has been made, and the sum of nearly 10,000*l.* paid out. This does not include damage to the arsenal itself, but only to private property. It will be remembered that in the "danger zone" by Woolwich more than half the windows in the shops and houses were broken, while some of the buildings were almost wrecked.

THE highways committee for the Kidsgrove Ward have reported that the surveyor had been approached by an architect from Fenton, who was in search of about two acres of land near the canal on which to build a large earthenware factory, and the architect had been shown the Council's land at Hardingewood, which he thought would

be suitable. The Council agreed to sell to the prospective purchasers, who at present are unknown, a plot of land situated by the side of the canal and the main line of the North Staffordshire Railway.

THE *Glasgow Herald* reports on good authority that an amalgamation is contemplated between two well-known steel roofing and bridge works in the Glasgow district which, if carried to a successful issue, will make the combined concern one of the largest in the kingdom. The principals are both very old-established and successful concerns, and as the one has a world-wide reputation in medium and light structural work and the other is equally well known as having successfully carried out some heavy contracts in recent years, the combination ought to be a strong one.

MR. H. DICKINSON, manager of the electric-lighting department at Leeds, informed the Corporation committed at their meeting that recent experiments have resulted in the discovery of alloys of tungsten and other rare earths which can be made into lamp filaments, apparently possessing very great advantages over the carbon filament hitherto employed. It was claimed that there was a saving of about 60 per cent. in the quantity of energy required for a given amount of illumination compared with the carbon filament lamps. To facilitate the trial by consumers the committee sanctioned the purchase of a few lamps for resale at the price of 4*s.* per 32 candle-power lamp, believing that any loss to the Corporation due to the reduced consumption of electricity per lamp will ultimately be more than compensated for by a resulting large increase in the number of consumers.

THE Town Council of St. Andrews has resolved to take a plébiscite of the ratepayers on the question of the augmentation of the water supply, and at a special meeting of the Council four schemes were selected, which have the approval of the engineers, Messrs. Bruce & Proudfoot. These, with the approximate cost, were as follows:—Lumbo Den scheme, an extension of the present supply at an estimated cost of 21,216*l.*; Lochty and Kinaldy joint scheme, cost 17,502*l.*; Cameron Burn scheme, 24,147*l.*; and a supply from Dundee, 26,131*l.*, with an additional charge for water of 571*l.* In connection with the Lochty and

CATHEDRAL SERIES.—SOUTHWARK: NORTH TRANSEPT.

joint scheme and Cameron Burn scheme it was ed out that in the course of the next ten years addi- filters would require to be provided at a cost of . All the schemes aim at providing a supply of o gallons a day—equal to fifty gallons per head per or a population of ten thousand.

LENGTHY report was read at the monthly meeting of the am Rural District Council by the Surveyor for the highway district, Mr. G. F. Surtees, as to calcium de as a dust preventive. The cost of mixing it and ding it had been 7½ a mile. Its effect upon the road e it had been applied had been very marked and very icial. On the Tyneside Agricultural Show day an ous traffic passed over about a quarter of a mile e the solution had been applied, and no one could fail e its good effect in keeping down the dust, as on the ing road the traffic was raising clouds of dust. How- many experiments were being carried out with dust- tives with a view to grapple with the dust nuisance, o doubt in the near future something more definite e be known as to the best and cheapest method.

a meeting of the Metropolitan Asylums Board on ay letters were read from the Local Government ating—(a) that they were advised that the estimated f the proposed additional storage accommodation for t the Eastern hospital was unnecessarily high, and y the managers to reconsider their proposals with a o a reduction in the expenditure; and (b) that they e prepared to issue an order authorising the proposed diture on the goods reception station and porters' at Joyce Green hospital, but that they were not pre

pared to sanction so heavy an expenditure as 3,042½ on the erection and drainage on the block of eight cottages, and asking the managers to reconsider the matter with a view to a reduction in the cost of that portion of the scheme. It was agreed "that the managers approve of the erection at Belmont, instead of at Peckham, of the new laboratories for the preparation of diphtheria antitoxin and for bacteriological work, and authorise the preparation by the architects, Messrs. T. W. Aldwinckle & Son, of an amended scheme upon instructions to be given to them by the hospitals committee."

A LOCAL GOVERNMENT BOARD inquiry in connection with the electricity undertaking was concluded last week at the Wednesbury town hall by Mr. H. R. Hooper, an inspector of the Board. The inquiry was into an applica- tion of the Corporation for sanction to borrow 10,000½ for the purposes of laying down a complete plant for the generation of electricity. The town clerk explained that the Corporation considered the time had come when they should have their own electricity undertaking. They were at present taking their power from the Midland Power Company, but the mains belonged to the Corporation, and they had now only to instal their own plant. Mr. Hayward, on behalf of the Midland Power Company, strongly opposed the application, urging that it would not pay the Corpora- tion to generate their own electricity, and he further pointed out that in that case the present agreement between the company and the Corporation would be liable to be deter- mined. The result of that would be that there would be three concerns which would have the power to supply electricity in the borough of Wednesbury—the Corporation, the Midland Power Company and the Mond Gas Company.

The British Consul at Riga, in his official report states that the timber trade naturally stands first at the port, and about 13,600 rafts were floated down from the forests in 1906. This, however, was below the average of the last twenty years, viz. 15,000 rafts. Notwithstanding this prices were favourable to buyers, mainly due to the lack of organisation amongst Riga exporters of sawn goods. They tackle more goods than they can comfortably finance. Their one idea seems to be to turn out as much stuff as they can and get it shipped off before the winter comes, so as to have less stock to finance over during the close time of winter.

The result is that, through fear of not clearing their production of the summer and autumn before the winter comes, and easing themselves financially by getting their money back, they operate one against another in making sales and forcing the foreign market. This is all to the advantage of the buyers in the United Kingdom, but it is not profitable to themselves. Already the Riga exporters begin to see that they have been over rash in selling ahead at lower prices. Not nearly as many sawing logs will arrive from the forests as they anticipated, and they are paying for their raw material much higher prices than ever they expected to do, and it is probable that prices for sawn goods will again stiffen—that is to say, unless the demand in the United States for Canadian spruce falls off, and spruce begins to compete in the United Kingdom with Riga white-wood again; but, unfortunately for Riga, Canadian spruce is taking a downward movement.

At the Birmingham police court last week a large firm of builders were summoned for that they, being the occupiers of a factory, neglected to securely fence a portion of dangerous machinery, in consequence of which a workman suffered injury on May 23 last. The defendants pleaded not guilty. One of H.M. Inspectors of Factories who conducted the prosecution said in one shop there were a number of machines driven by a gas-engine. Amongst them was a spindle moulding machine. The cutter revolved on the spindle at such a speed that it could not be seen going. It was a type of machine that was exceedingly dangerous and one that the Department insisted upon being protected. On May 23 a workman was feeding the machine when the wood kicked or moved, the man's hand slipped and his thumb was caught by the cutter. He sustained such injury that he was prevented from following his employment for thirteen weeks. At the time no guard was in use on the machine. The Inspector understood that the defence was that the guard produced was available for use if the workman had put it on, but his contention was that that guard was insufficient, and also that the employer was liable if the guard was not used. After hearing further evidence the chairman said the defendants had not proved to the satisfaction of the Court that they exercised due diligence as required by the Factory and Workshops Act. There was a technical breach of the law, because defendants

did not make it impossible for the machine to be run with protection. They would be fined 10*l.* and costs.

AFTER considering a report from a sub-committee aquarium committee of the Brighton Corporation recommend the acceptance of the offer of Messrs. J. F. Phillips Son, of Brighton, for heating the aquarium building at a cost of 45*z*l. At a meeting of the sub-committee Phillips advised that the work in the theatre and entrance hall could be completed within four weeks, and on behalf of his firm agreed to extend the guarantee of efficiency for two years to five years; to make good all defects within two years; to a retention of 10 per cent. of the amount of the contract for a period of six months; to give a guarantee of 55 degrees Fahrenheit in any part of the aquarium, with 25 degrees external temperature at 58 degrees with 32 degrees internal temperature; to give a guarantee that the whole installation shall be efficient and worked by means of the steam produced by one of the existing boilers only, subject to the condition that coal be substituted for the existing coke fuel, and if the guarantee is not fulfilled will carry out to the satisfaction of a borough surveyor such works as are necessary to furnish the required amount of steam without further cost to the Corporation; to give credit for old pipes, and to instruct the aquarium staff in management and working of the apparatus, and to instruct any new engineer appointed.

### ASSOCIATED PORTLAND CEMENT MANUFACTURERS (1900).

THE report for the year ended June 30 states that profits, after deductions, which include 138,619*l.* for repairs and renewals, amount to 403,524*l.*, making, with amount brought forward, 416,076*l.* After deducting managing directors' remuneration, directors and trustees' fees, 18,541*l.*; debenture interest, &c., 136,667*l.*; sinking fund, depreciation and reserves, 70,775*l.*; reserve for contingencies and doubtful debts, 10,000*l.*, a balance remains of 180,000*l.* The directors propose to carry to the general reserve depreciation account 25,000*l.*, and to recommend a dividend on the Preference shares to June 30 at the rate of 5½ per cent. per annum, leaving 36,208*l.* to be carried forward.

d. The profits during the past twelve months have some improvement on those of the previous year, owing to the increased demand for Portland cement in export markets. Prices have been somewhat during the period, but, on the other hand, owing to increased cost of fuel, the expense of manufacture has increased, and will certainly be still higher for the current year. It will therefore be necessary to obtain increased prices for Portland cement.

## THE ENGINEERING EXHIBITION, OLYMPIA.

The exhibition, one of the largest of the series held lately at Olympia, has been opened and viewed by a large body of representatives of every profession and trade. While, of course, the preference is given to mechanical engineering, there are many and various side issues which appeal to the architect. The show of moulding and machinery both for wood and stone is a very large and is representative of the latest developments in the construction of machinery to this work. There is the chain drive, and quite an array of general joinery and wood-working machines, and the higher developments of art and architecture are met by the introduction of paints and materials which are included in the catalogue. We shall in our next issues give details of these, but as they are in the early stages of forwardness it is unwise to single out for mention the products of any particular firm. It is to say that the collection is a large—we had almost very large—and a representative one. The managers, Mr. C. Smith and T. W. Bridges, are to be congratulated on the successful result of their labours and of the function which it was inaugurated.

## UNIONISM OF THE RIGHT SORT.

On the evening, September 6, the workmen did honour to their employer, Mr. Charles D. Phillips, Emlyn Engineering Works, Brass and Iron Foundry, by presenting him with a beautiful silver cigar-case, with the following inscription:—"Presented to Charles D. Phillips, Esq., J.P., by the Gloucester employés, as a mark of esteem and recognition of him as an employer." The presentation

was made by Mr. Haynes (foreman patternmaker), who in a few suitable words said how much they as workmen appreciated the deep interest Mr. Phillips had always taken in their welfare, and referred to the many generous actions shown on his part in the past. A few words were spoken by Mr. Andrew Glass, who endorsed Mr. Haynes's remarks, and assured Mr. Phillips that the same good feeling which the men at Gloucester had shown that day also existed at the Newport works.

Mr. Phillips, in responding, said it was a very pleasant surprise to him to be the recipient of this gift from his workmen. He was glad to see this good feeling existing amongst them, and he assured them he would always do his best, in the interest of his men, to maintain this good feeling, which during the past forty years he had always endeavoured to do. Mr. Phillips remarked that he himself was not born with a silver spoon in his mouth, and had had to work hard to build up the business which gave the workmen employment. It was a great honour, which he himself much esteemed, in these days to have his men show a very good example of good fellowship in the common cause to do the best for one another. Mr. Phillips, in conclusion, addressed, in a few words, the apprentices and young men, giving them some sound advice for their future conduct and welfare, exhorting them to put all their energy into their work. They should try to make themselves indispensable, as upon this would depend their future success and also the success of the trade of the country.

## ASSOCIATION OF HOUSE PAINTERS.

The annual convention of the National Association of Master House Painters and Decorators of England and Wales was opened in Liverpool on Tuesday by the Lord Mayor.

Mr. G. A. Morton delivered his presidential address. In explaining, says the *Liverpool Courier*, the objects of the Association, he said it existed to guard and protect the more commercial interests connected with the craft, but it was mostly concerned in maintaining a high standard of work and a true artistic excellence. By so doing it benefited in the highest sense both its members and the public alike.

First-class patent Factory Railways, Electric Storage Battery, Locomotives, Hoists, Elevators, Conveyors and every description of Transporting Machinery.

Its large influence had a far-reaching effect in obtaining fair and equitable settlements in those disputes which unfortunately occurred from time to time between master and man, and avoiding the serious losses to both capital and labour when resort had to be taken to a strike or a lock-out. It also protected the interests of the craft against any unfair monopolies of manufacturers. In regard to the education of apprentices, prizes were offered for the best work, both plain and decorative. It was a remarkable fact that in this country the provinces almost entirely provided the future workman. The apprentice, if not practically unknown in the Metropolis, was certainly not encouraged. Happily, a movement was now on foot in London to remedy that defect. Though they did not undervalue the great and good work that schools of art and technical schools were doing throughout the country, they felt that no system of education in the crafts was so good and so productive of the best workman as the old-fashioned way of apprenticeship. It was due to a conviction that master painters were failing in their obligations to their boys and young men, and that the schools of art and technical schools were not taking their place, that caused that Association to establish some four years ago a school of decorative painting in Manchester on the lines of those existing abroad, particularly in Germany. Owing, however, to lack of support, and the difficulty and expense of sending boys from districts distant from Manchester, the school was not successful in point of numbers, in which respect only was it a failure, and for the present it had been suspended. All efforts for the better education of the decorator would not avail so long as a mistaken system of competition prevailed. To the ordinary commercial mind there was only one kind of competition, namely, that of price. As a matter of fact, there were other kinds far more intrinsically important. There was competition in quality of work, in the artistic conception, and in the carrying out of a scheme and in avoiding excess, for good decoration did not necessarily mean superabundance, but in most cases the reverse. Competition of merit, not of price, was so frequently ignored that the painter of to-day had little time or encouragement to do his best work; his chief concern was not to lose on the contract. Colour, he proceeded to remark, was the real test of the true decorator. Most educated people could

appreciate a good colour scheme when completed, but were able to work out and obtain a really successful one. There might be all the difference in colours that there is in music between a pantomime song and a Beethoven sonata. Design in decoration seemed to him to have gone considerable change, and in some respects deteriorated during the past few years. Tracing the evolutions that had taken place in design he attributed these in some measure to the changed conditions of social life. We had now observed, the smart set, the eagerness for sport and motor-car, and we were expected to keep pace with it. There was no time to consider whether a design was good or not, something more exciting, if temporary, was demanded. Those conditions were bound to have an effect upon the decorative art of to-day, and to retard the advance of a purer, simpler, more refined and better style of decoration.

Sir William Forwood said it was a matter of great gratulation that their convention should have a practical side, and that they should not meet merely for the purpose of talking, but also of seeing what had been done in the processes of manufacture, and also the most recent materials with which they had to do. No one could go to that exhibition without being struck with the remarkable progress made in decorative art during recent years. The work of the apprentices and pupils showed that the education of their students was excellently carried out. So the examples of craftsmanship on exhibition were magnificent. Whilst admitting that their progress in decorative art had been very great, he thought they should consider themselves the question whether it had been, and was proceeding upon the right lines, and whether it was true progress or simply a reaction from a very bad period? They should also consider whether in regard to decorative art they had not arrived at a period where they were, so to speak, waiting for the development of a new art. It seemed to him that that was exactly what had happened at the present moment. Colour was the test of decoration. Unfortunately the new art strove after originality; he thought art ought to strive after beauty. It did not care what originality they might have; if the design itself was not beautiful the effect could not be good. He knew of a house built and decorated for a gentleman

When the work was finished was told by the architect must not have one picture in it. At last after great deal of persuasion this gentleman was allowed to hang just one picture of a distinguished tradesman and ancestor. He (Sir William) believed there was no more beautiful form of decoration than pictorial decoration of the highest class, and he did not believe decoration would be proceeding on right and true lines until it recognised that and led up to the pictorial form rather than turn it out of the house and discard it. Pictorial art in this country had made great strides, but they could not expect it to make great strides unless it had encouragement. If in carrying out their house decorations they excluded pictures, he wanted to know what was to come of the art of England. To adorn their houses with pictorial art was the best form of decoration they could adopt.

The first business session of the convention was held in the afternoon, when various reports were received and considered, dealing with the work of the Association in its various branches during the year.

### DEATH OF A STEEPLEJACK.

An inquiry has been held in Glasgow into the case of the fatal fall of John Goldie, a steeplejack, from the summit of a chimney at Messrs. Townsend's works, Port Dundas. From the evidence of a bricklayer, William Hall, it appeared that Goldie was employed to help witness, who, with his brother, were present at the time of the accident. Before the ascent was made there were certain preliminary operations, which witness described in detail. These operations were carried out by witness, his brother, Goldie and others. The ascent was made on a chair by means of an endless circular wire rope, the person making the ascent being able to regulate the height of the ascent. Witness saw Goldie at the top of the chimney shifting his block and tackle, an operation which he could do without any assistance. Witness noticed that Goldie managed to get the block to the place where he wanted it to be. The brim at the summit of the chimney was eighteen inches in breadth and the diameter of the flue measured 13 feet. The

chimney was the highest in the world. Including the iron-work at the top the chimney was 488 feet high. The brick-work was 466 feet high. Goldie was at the top of the chimney about half an hour. Witness and the others were waiting at the base of the chimney on Goldie signalling. The signalling was done by shouting. No shouts were heard by them until just at the moment they saw Goldie fall from the top. Previous to that witness observed that Goldie had gone round to the other side of the chimney in order to escape the fumes which were being emitted very thickly for a time. He did not think that Goldie could have been overcome by the smoke. Witness himself had spent a whole day on the chimney coping, and had not been seriously inconvenienced by the smoke. Around the top of the chimney were two rails—forming part of the iron crown which ornamented the top—one at the height of a man's waist, the other at a height a little above a man's head. These rails acted as a protection. Deceased had been on the head of the chimney on only one occasion previously. Witness ascended the chimney on the Saturday following the accident and found everything in order.

The jury came to the conclusion that Goldie's fall was not due to any part of the chimney or apparatus giving way.

### ENGLISH CHURCH, KHARTOUM.

Rapid progress is being made with the construction of the foundations of the English church at Khartoum. The site chosen is very convenient—a parallelogram of which the long sides face north and south, the latter fronting on Khedive Avenue, while the road bounding the former divides it from the gardens of the palace. At a short distance from the west is the open space in which has been erected the Gordon statue, and therefrom runs one of the main roads of the town towards the site of the new railway station. For climatic reasons the actual building of the church is being raised to a height of 2 feet above the road level, the spare ground being laid out as gardens, a pleasant feature made possible by the inclusion of the area within the bounds of the water supply of the palace. The whole is to be enclosed with a low wall and iron railings.

The plan takes the form of a Latin cross, having on the

south a detached campanile connected with the nave by a covered way, its lower part serving for a baptistery. Roughly speaking, the greatest length over all will be 54 mètres, the width of the chancel, nave and transepts 13 mètres, and at the crossing about 19 mètres. It has been designed to provide accommodation for about 600 persons. On each side of the nave and transepts are narrow passage aisles, and an ambulatory encompasses the chancel. The transepts will be arranged for use as chapels, that on the south for daily services, while the north transept is to be called the "Gordon Memorial Chapel," and will contain panels in memory of those who have fallen in the execution of their duty in the Soudan. Many of these have already been promised. The main entrance is at the west end, but this will be, as a rule, only for ceremonial or special occasions, side doors being provided both on the north and south within the shelter of the transepts, so that the prevailing winds being from one or other of those quarters an alternative means of access will always be available. The choir is raised three steps from the nave, and is furnished with a screen to be made of wood from the Bahr-el-Ghazal, with which also or with some other suitable native wood the stalls are to be made.

The design of the church itself is in many ways remarkable. One great principle has been kept always in view by Mr. Weir Schultz, the architect, that of absolute simplicity and utility. He has broken away from all the stereotyped "styles." There are pointed arches, because this construction reaches the ground quicker and does not need heavy buttresses to resist the thrust. The roof has a low pitch, because that is more suitable to the special local conditions, and the smaller windows and openings of the ambulatory are not arched, but built with simple sloping slabs, because this is more easily and cheaply done by the local labour available than the arched form. The material generally will be a sandstone of two colours, yellow and a pale red, which is got from a hill called Gebel Arli, on the White Nile, and about twenty-eight miles south of Khartoum. The floor will be laid with Soudanese marble and the roof covered with green glazed corrugated tiles; indeed, the church will be built with local labour and local material as far as possible, and the choice of its details is ruled by this important consideration. The windows will be shaded

from the direct rays of the sun, and in hot weather can be screened with mats to be kept cool with the trickle of water from a perforated pipe. Within, a fine and dignified effect is produced by the great constructional ribs which uphold the roof; all the more striking because they are not fretted with recrudescences of obsolete or alien ornament, but tell their own tale in the simplest of architectural language. The works are under the supervision of Mr. John Latimer, who is aided by the advice of Captain Done, R.E., Director of Military Works for the Soudan and a member of the church building committee.

To complete this great undertaking something like 7,000*l.* is still needed, not counting the cost of the campanile and a most necessary increase of the endowment fund. There is money enough in hand to carry on the building for about another year, and to avoid the waste and loss of an interruption in the work it is hoped that the interval of time may suffice for the raising of the remainder. A general appeal for help is shortly to be made.

#### MUNICIPAL BUILDINGS, EAST HAM.

The following letter has been sent by the Local Government Board to the Town Council of East Ham:—

"Sir,—I am directed by the Local Government Board to state that they have had under consideration the report made by their inspector, Mr. Hooper, and their architect, Mr. Kitchin, on the local inquiry held by them in reference to the application of the Town Council of East Ham for a provisional order to amend the East Ham Improvement Act, 1898, in regard to the erection of public offices, technical institute and other buildings referred to in section 82 of that Act, and in regard to the audits of the accounts of the Council.

"It appears that the amount sanctioned by the Act for the erection of all the buildings referred to—namely 55,000*l.*—was not based on any detailed estimates of the cost of providing the buildings, and that no plans have been prepared at the time of the passing of the Act. It would also seem that the requirements of the district have not at that time been considered in any detail, and that subsequently, when the Council decided to proceed with

## PATENT DIRECT-ACTING VERTICAL STEAM PUMPS

Park Works, MANCHESTER.

Salford Ironworks, MANCHESTER.

Queen Anne's Chambers, Westminster, LONDON.

erection of some of the buildings, they did not care-satisfy themselves beforehand as to the amount of expenditure which their proposals involved, or determine any degree of exactitude the scheme to be carried. The estimate of 55,000*l.* placed before Parliament as probable cost of all the buildings referred to in the Act had been exceeded very largely, notwithstanding that some of the buildings included in the estimate have not been commenced. The Board cannot but consider that the estimate adopted by the Council in regard to the erection of buildings is open to adverse criticism, and that to an appreciable extent the excess expenditure has been attributed to the want of due consideration beforehand of the cost and to the absence of carefully prepared estimates of expenditure involved.

It appears also from the report that the supervision of work when in progress was in some respects very satisfactory. In some cases orders for extra work or alterations of works appear to have been given by the clerk of works, instead of by the Council through the architect. Moreover, the measuring up of the work was done almost entirely by the clerk of the works, a course which is obviously undesirable. The Board understand that it is the duty of the architect, under the terms of the Council's agreement with him, to measure up the whole of the work, but this duty appears to have been delegated to the clerk of the works. The Board consider that the arrangement made by the Council with the architect in regard to this matter was unusual and undesirable, and that provision should have been made for the work being regularly measured up by an independent quantity surveyor. Under all the circumstances of the case, however, the Board are prepared to issue a provisional order to give effect to the several proposals included in the applications to the Council. The Board's sanction to any loan in excess of the sum of 5,000*l.* and 55,000*l.* authorised by the Act will be necessary, and the sanction cannot be given until the matter has been confirmed by Parliament.

The amounts for which sanction to borrow is desired by the Council appear to be:—(1) Excess expenditure incurred in connection with the public offices, technical institute, &c., 23,600*l.*; (2) additional buildings for the sanitary department and for education offices, 5,250*l.*

"As regards the first mentioned amount, the Board consider that certain items should be deducted from the proposed loan. A statement of these items, amounting to 2,022*l.* 7*s.* 10*d.*, is enclosed, and the Board would be prepared to sanction a loan for 21,578*l.* In fixing the period for repayment of this loan, the Board would regard as included in it all the capital expenditure incurred in the furnishing and equipment of the buildings.

"As regards the sum of 5,250*l.*, I am to state that the Board undertake that, in the event of new offices for the education staff of the Council being provided, an arrangement would be made with the Essex County Council under which the East Ham Town Council would be relieved of the loan charges in respect of the existing offices erected by the late School Board. Before further considering this matter the Board will require to be informed fully of the arrangement proposed to be made.—I am, sir, your obedient servant, ASSISTANT SECRETARY."

#### GLASGOW MAIN DRAINAGE.

THE works in progress for the sewerage of Glasgow were lately visited by members of the Corporation. The following are the contracts in progress:—Outfall sewer No. 1, contract No. 1—Messrs. James Goldie & Son, Ltd., contractors, 35,250*l.* 3*s.*; outfall sewer No. 1, contract No. 1a—Mr. John Watt, contractor, 48,595*l.* 8*s.*; outfall sewer No. 1, contract No. 2—Messrs. William Kennedy, Ltd., contractors, 61,813*l.* 16*s.* 8*d.*; outfall sewer No. 1, contract No. 2a—Messrs. Kinnear, Moodie & Co., contractors, 45,381*l.* 9*s.*; sewer No. 6, Dumbreck sewer—Mr. Andrew Blair, contractor, 5,874*l.* 9*s.* 9*d.*; Shieldhall works tanks contract—Messrs. James Goldie & Son, Ltd., contractors, 82,940*l.* 14*s.* The gross amount of these six contracts is 279,856*l.* 0*s.* 5*d.*; the gross value of work done on these to date is about 170,000*l.* The total length of main sewers to be constructed under the above five sewer contracts is 9,175 yards, of which 6,175 yards have been constructed, leaving 3,000 yards to finish.

The outlet works, Shieldhall, are being carried out by the Clyde trustees. Shieldhall machinery buildings—Sub-structures contract (Messrs. Good & MacKinnon, contractors),

The following work is still to be commenced:—Kinning Park pumping station, rising main tunnels, low-level sewer No. 4, from Kinning Park pumping station to Govan Street at Crown Street; reversing sewers along line of sewer No. 4, storm-water overflow sewer, sundry smaller works, Mount Florida, Cathcart and Pollokshaws; sundry accessory works, wharf barges, &c., Shieldhall; burgh of Govan intercepting sewer, by the burgh of Govan; Thornliebank sewer, by the County Council of Renfrew; Rutherglen sewers, by the burgh of Rutherglen and the County Council of Lanark.

### LOAD TESTS OF A FERRO-CONCRETE FLOOR.

On July 5 a series of tests was conducted under the direction of Messrs. Johnson & Baxter, architects, upon one of the floors in the new bonded warehouse erected for Messrs. James Watson & Co., Ltd., at Seagate, Dundee. The new building was designed of ferro-concrete, and includes some structural features of unusually interesting character. It takes the place of the warehouse destroyed by fire in September, 1906, and every precaution was taken to guard against any repetition of the disaster. The warehouse includes five storeys covered with a flat roof, and occupies a site of about 27,000 square feet. It is divided into three entirely separate sections by fireproof division walls, through which the only means of intercommunication are provided by firelocks. In addition to this novel structural feature, a very complete system of ferro-concrete ducts has been installed with the object of permitting the spirit to be drawn from any floor of the warehouse where an outbreak of fire may have occurred, thus facilitating the extinction of the flames by removing inflammable material from their vicinity.

The floor area selected for the purpose of the official tests was situated on the ground floor, and measured 19 feet 6 inches by 12 feet 6 inches. It is carried by one

of the main beams, 8 inches wide by 6 inches deep, inclusive of the floor slab, which is 3 inches thick. The construction, including main and secondary beams and continuous floor slab, is of standard Mouchel-Hennebly design, having bent longitudinal reinforcement to provide for continuous-beam action and transverse stirrups to withstand shearing stresses.

In compliance with the terms of the specification, floor area was loaded to the extent of  $3\frac{3}{4}$  cwt. per sq. foot, or 50 per cent. beyond the normal working load. The measurement of deflection three sensitive instruments giving readings in 500th parts of an inch, were placed beneath the beam, one in the middle of the span and others at the distance of 6 inches from the supports. The following table we give the various deflections observed during the process of loading:—

Time.	Load in cwt. per square foot.	Deflection of decimals of an inch.		
		Left-hand end.	Middle.	Right-hand end.
12 Noon	0.00	0.000	0.000	0.000
—	1.64	0.004	0.036	0.016

2.15 P.M.	2.79	0.020	0.096	0.020
2.40 P.M.	3.77	0.040	0.164	0.040
3.40 P.M.	3.77	0.040	0.168	0.040
4.0 P.M.	3.77	0.040	0.168	0.040

\* This load remained unaltered for one hour.

At 4 P.M. unloading was started, and at 9 A.M. on succeeding morning, when the load had been entirely removed, the deflection registered was scarcely appreciable. By 12 noon of the same day the indicators of the instruments all pointed to zero.

The maximum deflection of 0.168 is equivalent to  $\frac{1}{10}$  of the span, which compares very favourably with the portion of  $\frac{1}{80}$  permitted by the terms of the specification.

Other satisfactory points were that no surface cracks were developed in the concrete, and that the perfect tightness of the construction was proved by the disappearance of deflection on removal of the loading.

**GERMAN ADMINISTRATION OF BUILDING LAND.**

Good example of the scientific manner in which German municipalities attack administrative problems is shown by their housing policy. Germany, like Britain, has gone through an industrial revolution, and is changing from a nation of agriculturists to one of urban manufacturers. Hence, precisely the same problems of overcrowding, and the consequences which overcrowding brings, present themselves. Germany, however, is unlike Great Britain in being recognised that her industrial prosperity depends on the maintenance of a healthy population, and has set itself to secure this by a municipal housing policy with a consistent and scientific thoroughness unknown in this country. Owing to the fact that local authorities in Germany have a freer hand than have similar bodies in England, the details of that policy vary from town to town and state to state. The essential characteristic everywhere, however, is that German municipalities do not shirk their duty simply to meet the evils of overcrowding when they are so conspicuous as to be intolerable, but to make plans in advance which shall, as far as possible, prevent the evils from arising. On the ground that prevention is better than cure, they are continually planning and adopting measures which in this country would be described as "biting the bullet" or "unnecessary," because they show the forethought as would be required by shareholders of any board of directors of ordinary competence. There are three main lines along which municipal action with regard to housing has proceeded. The first is concerned with the acquisition of land, the second with the regulation of building, the third with taxation. A German expert who visited England some time ago remarked that the primary need of our towns was the adoption of a far-seeing and transport policy by local authorities, and added, "that respect our German communities are in a far more fortunate position." How that more fortunate position has been brought about may be gathered from a Prussian law as to housing of 1901, which urges that all municipalities shall, in the first place, retain in their own hands

all the land which they possess, and, second, purchase more land whenever it comes into the market. "The evils which at present prevail have their chief source in an unhealthy speculation in land [*i.e.* because such speculation raises rents]. . . . An effective remedy for keeping it within bounds can be found in the acquisition of as many plots of land as possible by those towns where constant growth is transforming agricultural and garden land into building land . . . it will certainly be in conformity with a sound land policy if even towns in which a house famine exists do not sell outright those parts of the land they own which are suitable sites for cheap dwellings. . . . The community should keep the right of pre-emption or some other adequate security that the plots of land will be permanently withdrawn from private speculation." The effect of this decree was analogous to a circular letter from the Local Government Board specially requesting British municipalities to buy land whenever they saw an opportunity of doing so. That the policy recommended is popular with local authorities is shown by the large amount of land held by many of them. Thus six towns own from 23 to 59 square yards per head of inhabitants; nine towns, including Berlin, from 60 to 120 square yards; five towns from 120 to 240 square yards. In the words of the Minister of Commerce of Hesse, which has established a national credit bank to lend money to towns acquiring land, "The early purchase of land in all parts of the country must be regarded as the first duty of towns."

When land cannot be acquired voluntarily the question arises whether expropriation should not in one form or another be sanctioned. The importance of giving municipalities the power to acquire land by compulsory purchase, when it appears desirable to do so, is not so necessary in Germany as in Britain, owing to the fact that the policy of voluntary purchase has there so long been in operation. Nevertheless, the powers possessed by German municipalities are considerable. The Saxon law confers on municipalities the power to compel an owner who hinders the laying out of streets or the creation of an orderly building plan in suburbs, by refusing to part with land, to surrender his plot in return for a similar plot elsewhere. Thus suppose the owners of five-sixths of a district suitable for houses want to build, and are prevented by one who

holds an essential piece of ground in the centre or at the corner, and who refuses to sell it or build on it, they can appeal to the municipality to compel him to part with the land. In addition to this power of land redistribution, Saxon municipalities can, with the approval of the Minister of the Interior, compulsorily purchase land, not only, as in this country, to meet a specific and immediate need, but also when, on general grounds, such purchase seems likely to be in the public interest. An example of this policy is supplied by the town of Düsseldorf, which has recently incorporated a large area of surrounding country by purchasing it from the State or from private owners. "If," it stated, "a private owner is unwilling to sell, the town applies to the Landtag (i.e. the State Government), and if it can show that possession of the land is necessary for the welfare of the town, the Landtag compels the owner to sell." The practical effect is to enable a community to regulate its growth in accordance with a preconceived plan.

Such regulation can, however, be achieved without actual ownership by the system of "building plans," or "building zones," which form an important part of the housing policy of German municipalities. The essence of this system is given in the words of the Prussian Dwellings Bill of 1903:—"To prevent the price of land in and near towns from being raised through the town's extension plans not being prepared early enough, the local police authority must have the right to demand that building lines shall be decided on, and that streets or parts of streets shall be constructed. In the preparation of building lines care must be taken that squares, sufficiently numerous and large, and public gardens and playgrounds are provided for." That is to say, before any district as yet unbuilt upon is laid out for building, the local authority must prepare a building plan. This plan, which is ready perhaps several years before operations actually commence, specifies within what areas houses may be built, the lines of the streets, and the spaces to be reserved for public or private gardens, as well as the height of the buildings and their distance from each other. It would be tedious to give the details of these regulations, but their far-reaching character can be seen from what has been said. Their effect is not likely to be underestimated by anyone who compares with the squalid

suburbs of London or Glasgow the way in which open spaces and breathing room between house and house are preserved in the neighbourhood of the larger German towns. Instead of the growth of an old city reproducing new slums around it, as is done by the manufacturing towns of Great Britain, where buildings are erected without regard to posterity, and, of course, without a thought to beauty or pleasantness of life, the system of building plans introduces an orderly and regulated growth, based upon a reasonable forethought and the use of scientific knowledge which is not within the reach of our grandfathers.

Finally, there is the question of rating. The principle that land which is capable of being used for building must not escape with a low rate simply because its owner chooses to put it to a less productive use, or to no use at all, has been accepted by a large number of towns, and formed the subject of a recommendation made by the Prussian Finance Ministry in 1899 to those towns which had hitherto not adopted it. So far from being a device adopted by greedy municipalities, the system of rating land according to its selling value has received the imprimatur of the Prussian Government, which has prepared model by-laws for the guidance of small town councils as cared to adopt them. The effect, it is argued, is to tap the unearned increment received by persons whose land appreciates in value simply because the community's need for it is becoming imperative, and to discourage land speculation. It would be out of place here to enter upon the merits of such a policy; but it may perhaps be pointed out that the question which of various interests united in a site bears the burden of a rise in site values—a question which is dear to lawyers, and which is not answerable with any certainty—does not arise, however it is answered, the expediency of throwing the burden of rates on to sites rather than on to buildings. Frankfurt-am-Main has, indeed, gone unusually far in attempting to get at the unearned increment. When a property is sold it levies a rate upon any increase in the value of the property over that shown by the last valuation. No rate is charged on an increase of less than 30 per cent. 5 per cent. is charged on an increase of from 30 to 40 per cent., 10 per cent. on an increase of from 40 to 50 per cent., and 20 per cent. on an increase of 50 to 74 per cent. and 20 per cent. on an increase of 74 per cent.

## EDITORIAL NOTICES.

One of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff a VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

## TENDERS, ETC.

\*\* As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

## COMPETITIONS OPEN.

BOOTLE (LANCS).—Jan. 31.—The Bootle education committee invite designs for a public elementary school for 1,000 children. Conditions and particulars may be obtained from Mr. J. Henry Farmer, town clerk, Town Hall, Bootle.

CEMAES.—Oct. 15.—The Twrc-lyn Rural District Council invite plans and specifications for a drainage scheme for the village of Cemaes, Anglesey. Competitors are requested to state the remuneration required by them for the plans, specifications and supervision of the work. Mr. Thomas Hughes, clerk, Brynaethwy, Menai Bridge.

DOVER.—Oct. 14.—The committee of the Dover pageant, July 27 to August 1, 1908, invite coloured designs for a suitable double-royal poster (40 inches by 25 inches). There should be some indication of the sea, a ship and Dover as the key of England. Prizes of 10l., 2l. 10s. and 1l. are offered. The prize-winning designs will become the absolute property of the committee. The Secretary, Pageant House, Dover.

LONDON.—Oct. 14.—The Acton District Council invite architects who have been in practice for at least seven years to send in to Mr. Wm. Hodson, clerk, 242 High Street, Acton, W., before Oct. 14, designs for erection of the proposed Council offices, at a cost not exceeding 18,000l. An assessor will be appointed, and premiums of 100 guineas, 50 guineas and 25 guineas will be awarded for the designs selected by the Council after their consideration of the assessor's award. Particulars can be obtained upon the payment of 10s. 6d.

## CONTRACTS OPEN.

WREXHAM.—Oct. 1.—For pulling-down and rebuilding a stone boundary and other works in Regent Street. The Borough Engineer's Office, Willow Road.

An unexpected sequel has occurred in connection with the Chatham Corporation's experiments in tarring the highway in New Road with a view to minimising the dust nuisance caused by the passage of motor-cars. The tar adhered to the boots of people who had to cross the road, and the floor of the new Presbyterian church was badly soiled, marked and discoloured. The authorities of the church have called upon the Corporation to bear the cost of scraping and polishing the floor, but the latter body declines to admit any responsibility.

## TENDERS.

## TRADE NOTES.

A clock tower is being built at Tiverton, Devonshire. It will have a chiming clock with three large dials, by John Smith & Sons, Midland Clock Works, Derby, who made a clock for a similar tower at Torquay several years ago.

WE are informed that the Kleine Patent Fire Resisting Flooring Syndicate are on the 30th inst. removing from 9 St. Helen's Place to more central and convenient offices. Their address will therefore in future be Museum Station Buildings, 133-6 High Holborn, W.C. The new telephone number will be 3098 Gerrard.

THE Bath Stone Firms, Ltd., have supplied their Monk's Park stone for the completed additions to the Norwich Shire Hall (Mr. A. Trench, architect, Norwich); for the new Inland Revenue Office at Southampton (the Office of Works) and for St. Andrew's Church, Oxford, which is in course of construction, Mr. A. R. G. Fenning, the architect, has employed Farleigh stone for the interior.

MESSRS. CLARK & Co. request us to announce that, in order to meet the rapidly growing requirements of their London business, they have opened a store at King's Cross station, and that they can supply at once from stock at prices giving small quantities the benefit of the truck-load rate of carriage; and that they are prepared to undertake work with Xelite plaster, and to guarantee satisfaction. Messrs. Clark & Co. recently executed work at Windsor and Knightsbridge Barracks for H.M. War Department, and the whole of the Caversham public library, and have several other contracts in hand.

MESSRS. GEORGE MILLS & Co., engineers, Radcliffe, near Manchester (proprietors of the "Titan" sprinkler), have received the following letter from Mr. Thos. C. Keay, 7 Ogilvie Street, Dundee:—"I beg to inform you that on the evening of August 19, about ten o'clock, while one of my apprentices was passing the works, he saw from the windows a flare of light, and, suspecting that something was wrong, he at once communicated with the fireman. While the fireman was getting up towards the gate the gong went off, and by this time a rush of water was coming out of the gateway. They found on entering that one of the sprinklers had gone off right alongside the boiler and had extinguished the fire. This was all the damage, and my claim with the insurance company was only 4/ 13s. I may say that this was one of the most dangerous parts of our works, and it is very gratifying to know that the fire was so quickly arrested and so little damage done, which is strong testimony of the efficiency of your installation."

# "Standard"

"Standard" Porcelain Enamel Ware is moderate in cost, beautiful in its finish and extremely durable. Absolute freedom from cracks or crevices assures the maximum sanitary protection. A bathroom fitted with "Standard" Ware greatly increases property value.

Write for our elaborate booklet, "MODERN BATHROOMS," also for our special lavatory booklet, showing many new patterns. Ask for Booklet No. 6, post free on application to Dept. F.

### L.C.C. SCHOOL OF BUILDING.

THE prospectus and time-table for the session commencing September 24 has been issued. The school is in Ferndale Road, the principal, Mr. H. W. Richards, is assisted by Mr. A. R. Sage, and Professor Beresford Pite is director of architecture. The classes are divided into three sections—trades, construction, and architecture and drawing—and will be open from 7 P.M. to 9.30 P.M. on each week day except Saturday. The fee is 10s. for the session, apprentices being admitted free. The school has been established by the Council to enable artisans and others engaged in the building and allied trades to acquire an intimate knowledge of the principles that underlie the processes which they have to carry out in their daily work. Workshops have been provided and equipped for the practical teaching of the several building trades under conditions similar to those met with on buildings and in builders' shops. Great importance is attached by the Council to the practical combination of the studies in the several trades and branches as required by a master builder, foreman or architect, and facilities will therefore be given for combining architectural studies in practical and theoretical work in the workshops, lecture-rooms and drawing offices.

### THE ENGINEERING EXHIBITION.

THE collection at Olympia, while of paramount interest to the engineer and mechanic, has also a few novelties which will undoubtedly interest the architect. The show itself is a fairly good one. Engineering in construction is being brought into a closer alliance with architecture, but it is rather with the mechanical than the constructive side of engineering that the appliances seem to be chiefly concerned. These are many. A great deal of the space is taken up with lathes and drilling-machines. A number of automatic bevel-gear planing and milling machines are to be seen at the stand of Messrs. Pfeil & Co., of Bloomsbury. There is a very fine new type of engine shown by Messrs. Burton. This machine has a new design of feed-box, which enables one to change the speed without stopping the machine. There is also a fine collection of turret and automatic lathes on view. There are, of course, numerous other well-known machine-tool makers exhibit-

ing, but as the exhibition is to remain open for four weeks and many stands are not in a forward condition, we must return to these in detail in a later number. In the hexagon turret lathes displayed by Messrs. Alfred Herbert, Ltd., of Coventry, there are some notable improvements. Every effort has been made to obtain greater power, a wider range of cutting speed and improved facilities for changing gear. Especially noticeable are the businesslike milling and automatic screw-making machines.

Messrs. M. Glover & Co. have a representative display of their patent machinery for sawing, splitting and bundling firewood; also their new patent "Ideal" saw guards. A smart little tool exhibited is their handy pattern shop saw bench.

Messrs. Thwaite, of Bradford, and Messrs. Reavell, of Ipswich, show air compressors which are installed on every warship of the Royal Navy for supplying compressed air for the torpedoes. Messrs. Thwaite show a very clever and ingenious electrically driven water-pump. It is so arranged that the delivery can be varied from zero to a maximum while the pump is running. There is no alteration in the length of the stroke of the pump, and, what is more remarkable, it is claimed that there is no loss of efficiency. Mr. Reavell has devoted a great deal of time to the study of machinery capable of dealing with gas for high pressures. One of his exhibits has been sold to a French firm. Several well-known firms are exhibiting suction gas plants and gas-engines. This method of obtaining power is rapidly becoming more popular, especially for power installations in the country. It is all but impossible in one short notice to convey anything more than a general impression of the exhibition.

PLANS have been filed by Messrs. McKim, Mead & White, architects, for enlarging the Metropolitan Museum of Art, in Central Park, New York. The additions will be two and three storeys high, brick and stone, one annexed to the museum library on the south, 116 by 183 feet; the second to be added to the exhibition halls on the north, 54 by 119, and the third to be 15 feet frontage and 21 feet deep at east of the hall of sculpture. The three additions are to cost 450,000 dols.

# MARPEDO WHITE JAPAN

## SLOW DRYING.

It is easy to manipulate, and large areas can be covered evenly. When dry it presents a hard, brilliant and durable surface, which will not crack. A properly prepared surface one gallon of MARPEDO SLOW-DRYING WHITE JAPAN will cover about 80 square yards. It dries in about 12 hours.

## VARIETIES.

THE sub-committee of the Lancashire education committee have sanctioned the erection of a new elementary day school at Brierfield, to cost 11,000*l.*, and of one for Trawden at an estimated cost of 9,000*l.*

AT Liverpool workhouse committee it was stated that there were four applicants, including one lady doctor, for the post of assistant medical officer, and 270 candidates for the post of engineer at the workhouse.

ON Saturday last, the 21st inst., Mr. Robert W. A. Gelfillan was married to Miss Eleanor Blanche Colcutt, daughter of Mr. Thomas E. Colcutt, president of the Royal Institute of British Architects.

ELECTRICAL works are to be established at Cherbourg at a cost of 40,000*l.* for the purpose of providing power for the lighting of the Arsenal workshops and for charging the accumulators of submarines.

It has been decided to recommend the appointment as electrical engineer to Walsall Corporation of Mr. A. S. Barnard, late electrical adviser to the Ceylon Government and the Colombo municipality, formerly electrical engineer to the Hull Corporation. The salary commences at 400*l.*, rising to 450*l.*

MR. THOMAS WILLIAM MINTON, who was for many years a member of the famous pottery firm of Minton, Ltd., of Stoke-on-Trent, died at Enfield on Tuesday at the age of sixty-three. Mr. Minton was one of the best-known men in the Potteries, and served the office of Mayor of Stoke-on-Trent.

THE Ballymenagh 100-guinea trophy, which has been handed over to the Roads Improvement Association, has been awarded by the judges' committee of the recent tar-spreading competitions, together with their gold medal, to Messrs. R. S. Clare & Co., Ltd., of Liverpool, for their patent tar compo.

AT the last meeting of the Court of Common Council a letter was read from the London County Council to the effect that the new district surveyors in the City under the London Building Act of 1894 were:—Mr. J. Todd, Hamilton House, 149 Bishopsgate Street Within (eastern district); and Mr. C. W. Surrey, 134 Fleet Street (western district).

THE Chichester City Council have resolved that the education committee be instructed to get their architect to prepare a plan for a new school in Tower Street to accommodate as many boys as possible, and prepare a sketch plan for a new school in Little London where the present school stands, and that he be also asked to view any other suitable sites in the vicinity of Little London.

A PAINTER had an escape from death in Campbelltown, N.B., on Friday. He was working on the ledge of a window at the rear of a building in Londrow and fell from a height of three storeys. In his descent he alighted on the roof of an outhouse, which broke his fall somewhat, and he then fell to the ground. He suffered from shock, and his left arm was broken, but after being medically attended to he was able to walk home.

A WORKMAN employed by Mr. W. Everard, builder, was getting out foundations at a depth of 10 feet in Haydn Road, Nottingham, when, after breaking off a huge lump of rock sand with a crowbar he saw a small moving object. Closer examination showed that it was a live crab, the shell measuring 3 inches by 2 inches. It has legs and feelers like the ordinary sea crab, but the shell has sharp ragged edges. It is thought that the crab is three or four thousand years old.

AT a meeting of the lighting sub-committee of the Liverpool tramways committee the superintendent of street lighting reported that he had dealt with thirty-one applications for the testing of consumers' gas pipes and fittings since the last meeting. Twenty-eight were found to be unsound, causing the gas to escape at the aggregate rate of 20½ cubic feet per hour, representing an annual loss with gas at 2*s.* 6*d.* per 1,000 cubic feet of 22*l.* 0*s.* 8*d.*

It was reported in the North Worcestershire and Staffordshire iron trade that the late heavy drop in galvanised sheet-iron prices was having the effect of worsening American competition. The reduction, which was 2*s.* on sheets of thirty-gauge and 1*s.* on twenty-four-gauge, was dictated by the breach by the American makers of an understanding with English firms regarding prices and territories abroad.

As a result of the fall in copper which has taken place during the past three months, the prices of brass and copper tubes and brass and copper wire have been correspondingly

ed. The Associated Tube Manufacturers have lowered prices during the past week by  $\frac{1}{2}d.$  per lb., making the price of brass solid drawn tubes  $8\frac{1}{4}d.$  and copper  $10\frac{3}{4}d.$  brass has been fixed at  $6\frac{3}{4}d.$  to  $7\frac{1}{4}d.$  per lb., according to quality.

LETTER has been sent by the chairman of the sanitary committee and the medical officer of health of Newcastle-Tyne to municipal and other bodies concerned with government, asking them to appoint representatives and a preliminary conference to be held in London in November next, for the purpose of considering the question of establishment of a permanent union of the sanitary authorities of the kingdom into a supreme national health authority. The object of the proposed health authority is to promote uniformity of action on the part of sanitary authorities generally in furtherance of questions concerning public health of the country.

the International Conference on Tuberculosis which has just been held in Vienna, it was most emphatically urged by each speaker that in all future cases of erection of sanatoriums the following case should be specially borne in mind. An architect in Germany had designed a sanatorium at a cost of 8,000 marks (say, 400*l.*) a bed, but a time afterwards the same architect in the same country had designed and erected precisely the same sized sanatorium at half the cost. The results of the treatment in the two establishments were identically the same. The Conference urged the providing of more sanatoria, but that less money should be spent on their erection and more accommodation be thereby provided.

THE Town Council of Peterhead, N.B., have accepted the offer of Messrs. Shanks & M'Ewan, St. Vincent Street, Glasgow, to carry out the whole of the works in connection with the new water supply scheme for Peterhead. Thirteen tenders were received from contractors in various parts of Scotland, the offers ranging from 33,723*l.* down to 17,530*l.* A condition of the contract is that the new supply has to be made available for the burgh at the end of April 1908. The scheme includes a complete system of gathering works in the Cairn Catla Valley, and the existing storage reservoir at Forehill—a short distance inland from Peterhead—is to have its capacity increased from two million to six million gallons. The engineers are Messrs. Walker & Duncan, C.E., Aberdeen.

THE report of the sub-committee appointed by the rivers committee of the Manchester Corporation to inquire into the case of the men at the Davyhulme sewage works, who were discharged (as the men alleged) on account of their joining a trade union, has been prepared. It states that the men have not substantiated their complaints as to victimisation because of membership of the newly-formed branch of the Corporation Employés' Association. The sub-committee accept the statement of the manager that he did not even know the men were discharged, and that the men finished automatically on jobs being completed. A partial reason for the discharge was that owing to the adoption of the manager's scheme of clinker washing workpeople were displaced. The men discharged will, however, be reinstated as vacancies occur.

THE works committee of Dundee School Board on Monday approved of plans for the erection of a new school in the northern district of the city to take the place of St. Salvador's Episcopal school, recently given up by the managers. The plans, which were prepared by Mr. J. H. Longlands, architect to the Board, show a building two storeys in height. It contains 24 classrooms, the total number of pupils provided for being 1,270. In the plans provision is made for the construction of a circular bathing chamber, but so far this has not been adopted by the Board, although sanction was recently given for baths in two other schools attended by children of the poorer class. The school is estimated to cost 15,000*l.*

MESSRS. BROWN, BAYLEY & Co., Sheffield, have erected a steel chimney over 100 feet high, raising it in a single piece. The chimney weighs 22 tons, and is 10 feet in diameter at the foot, tapering to 7 feet at the top, and it is said to be the highest steel chimney in Sheffield. Its object is to serve an open-hearth melting furnace of 20-tons capacity, built on steel stanchions and girders instead of brickwork. The chimney was raised by slings of wire rope supported from a high derrick, the base being guided into the flange of a large iron base-plate, to which it was bolted with bolts 32 inches long. It has no supports or stays of any kind, but the brick base goes 20 feet into the ground, and the base-plate is secured to the foundations by eight massive bolts about 16 feet long.

MR. ALBERT HALSTEAD, the United States Consul at Birmingham, has informed the Washington Bureau of Manufactures that a local company engaged in the manufacture of hansom cabs has decided to go out of business because of the immense falling off in the demand for these vehicles. He continues that the cause is the development of underground railways in London and the increased use of motor buses and motor cabs. To this might be added the extension of the street car systems throughout the kingdom. Then, also, the demand for private cabs, which was formerly large, has disappeared, automobiles taking their place. The vehicle was invented seventy years ago by a Birmingham architect, Joseph Aloysius Hansom.

A HANDSOME drinking fountain has been unveiled at the Baltic Mercantile and Shipping Exchange, St. Mary Axe, E.C., by the chairman, Major Bridges Webb. It is surmounted by a life-size figure in bronze, representing a Nymph of Fortune supporting a boat, which symbolises the Baltic. The niche is of alabaster and coloured marble, while the floor is of coloured marble and mosaicwork, with the crest of the Baltic introduced. The work was exhibited this year at the Royal Academy, the sculptor being Mr. E. Whitney-Smith. The casting was done at Burton's Foundry, Thames Ditton, and the architectural work was executed by Messrs. J. Whitehead & Sons, Ltd., Kennington. The fountain, it may be added, was presented to the members of the Exchange by the late Mr. Edward Power, a gentleman who was for many years connected with the

Baltic, and his son, Mr. E. J. Power, one of the directors of that institution.

At the annual meeting of the Scottish Building Federation, held in Dundee, Mr. Patrick Knox, Edinburgh, occupied the chair, and delegates were from Edinburgh, Glasgow, Aberdeen, Dundee, Inverness, and other centres. A resolution was unanimously adopted protesting against the Secretary for State's decision to add a member of the Scottish Building Trades' departmental committee appointed by him to inquire into the system of scaffolding in England and Scotland. It was stated that the committee as at present constituted was not familiar with the customs and practices of the building trades in Scotland, and more particularly with several modes of Scottish scaffolding. The interests of employers in the building trades in Scotland, it was thought ought to have been directly represented on the departmental committee by a Scottish employer familiar with Scottish methods. Grave hardship might result as a consequence of the committee's findings, and the meeting resolved to test against the manner in which employers in the building trades had been ignored, more especially as it was intended to apply certain new scaffolding regulations to Scotland. The secretary was instructed to forward a resolution to the Secretary for State, the Lord Advocate, and the members of Parliament for the towns represented in the Federation. Mr. William Nicoll, Dundee, was elected president for the ensuing year, and Mr. Leslie, Aberdeen, vice-president. It was agreed to meet at the next meeting in Aberdeen.

MR. EDGAR DUDLEY, an inspector of the Local Government Board, held a public inquiry at the Hornsey municipal offices on the 19th inst. respecting an application made by the Borough Council to the Local Government Board for sanction to borrow 39,690*l.* for the purpose of extending their scheme of providing municipal dwellings under Part III. of the Housing of the Working Classes Act, 1901. The Hornsey Borough Council have now 308 dwellings, North Hill, Highgate, and Nightingale Lane, Hornsey, the capital expenditure upon which has been 94,485*l.* The rentals vary from 6*s.* a week for three rooms to 11*s.* a week for seven rooms and a bath-room, and all are

## THE "SAMSON" SOLID BRAIDED SASH LINE.

Size No. 8. Diameter 1 1/2 in.  
Will outwear a hollow-braided line twice.  
IT IS USED BY THE BEST BUILDERS.

WM. E. PEO  
8 BRADFORD AVENUE,

ly let. The new scheme provides for the erection of additional workmen's dwellings at Highgate upon land freed from the Ecclesiastical Commissioners. There are 22 cottages at 12s. 3d. weekly, 26 at 10s. 6d., 24 at 10s. 2d., 22 at 9s. and 26 at 7s. 6d. The estimated capital outlay for the erection of the cottages, draining, paving and laying-out and sewerage of the roads is 39,690l., which must be added 5,700l., the cost of the land, making a total of 45,390l. The money is to be borrowed for sixty years, and the suggested rentals will provide an income of 3,040l., sufficient to meet the annual repayment of capital and interest, rates, taxes, &c., and to leave a surplus of 9½ per cent. of the rental value for empties and repairs. A number of ratepayers opposed the scheme. It was urged that the Council by this "municipal trading" was entering into unfair competition with existing house property owners, that the more expensive of the cottages would be superior to houses rated at 30l. or 35l. a year, and that there was really no necessity for the scheme.

### "EBONOID."

When flat roofs were first suggested they were looked on as a Utopian. Englishmen had a weakness for Gothic, and the *raison d'être* for Gothic consisted mainly in the display of gabled roofs. Time demonstrated that valuable space was wasted, and that it was possible, not only to employ a flat roof for business purposes, if necessary, but to convert it to a healthful open space. No sooner was the transposition desired than means were devised for meeting all requirements with more or less success. Messrs. Joseph Watson & Co., Ltd., of Carlisle Chambers, Crooms Hill, London, have in their "Ebonoid" a flexible material which is adapted for flat roofs, whether of wood or concrete, which also serves for a number of other purposes. As it is damp-proof it can be used as a roof-garden, and as it is resisting there is no risk in employing it. One firm in London have utilised it to cover nine roofs, another firm in the same town four roofs. In fact, many thousand super-yards have been laid in the United Kingdom and in India. One reason for the success arises from the long acquaintance with construction possessed by the firm. This is seen by the illustrations, which are genuine

working drawings showing all the details, and which would enable any ordinary builder to carry out roofing on the system. The prices are as low as any occupant of a house can desire, for "Ebonoid" can be supplied with fixing material and nails for 1s. 1½d. per superficial yard.

### CHEAPER RATES FOR FOREIGN LETTERS.

THE Post Office announces that the Postal Union Convention concluded at Rome last year comes into effect on October 1 next, when various important changes will be made in international postal arrangements. The postage on a letter from the United Kingdom for a foreign country will be 2½d. for the first ounce and 1½d. for each subsequent ounce. The postage to British possessions generally, to Egypt, and to British ships of war on foreign service, will be 1d. per ounce instead of half an ounce. Reply coupons will be issued enabling the sender of a letter abroad to pay for a reply. As to postcards communications will be allowed on the left half of the front as well as the back. Pictorial cards bearing no written communication will be transmissible at the printed papers rate.

### NEW CATALOGUE.

We have already noticed the "Hatfield" pump of Messrs. Merryweather & Sons, Ltd., which is one of the most efficient hydraulic machines ever invented, more especially for domestic requirements. Not only with its aid is it possible to have an ample water supply for country mansions, but it may be used for a number of houses in villages or on large estates. The motive-power can be derived by gas or oil-engine, or by electric current, or even by wind-power. It is therefore cleanly and occupies a surprisingly limited space when we consider the work it can accomplish. It is also adapted to meet the necessities of ancient mansions like Hatfield House, of large West End mansions, hotels, manufactories, or for use in the Colonies and India. In most parts of the world examples are to be seen at work. In their latest catalogue Messrs. Merryweather show new applications of the "Hatfield" pump, which with the variable stroke mechanism is able to cope with all the difficulties of water supply.

## ERKEFELD FILTERS

## SMOKE PREVENTION.

At the conference in Llandudno of the Sanitary Inspectors' Association a paper was read by Sir William B. Richmond, R.A., on smoke abatement. He had, he said, lectured and spoken for so many years on the subject of pollution by smoke from factories, upon the selfishness of manufacturers and on the inertness of the British public which permitted the pollution, that every sentence he now used appeared to him to be little else than a collection of platitudes and truisms. But it did not do to let things slide, even when one's mind was made up. It took a deal of trouble and pains to instil higher and more altruistic aims into people who sat still unmoved and unconcerned in an atmospheric *status quo* as long as money poured in, even if in the meantime the sun was being "put out." Coal smoke was merely waste of fuel. It was a destructive and disagreeable agent, and it was as preventable as it was unnecessary. What was wanted to secure its prevention was that public opinion should shake off its inertia, and with one voice proclaim its determination to force the hands of the selfish or thoughtless, and oblige them to cease from abusing their prerogatives of wealth, to abstain from damaging other people's property, destroying beauty, making dirt and obscuring the sun, the giver and disseminator of life. The absurdity of the defence of the nuisance that "smoke and commerce were inseparable" was shown by the fact that every puff of smoke from a chimney-shaft was waste, and it was therefore unbusiness-like to permit it. Those who did permit it were short-sighted as to their own interests and inconsiderate towards others. But man did not live by bread alone. We had in this country great beauty of landscape. Especially had this been so in those districts which had now become squalid and unhealthy owing to the smoke curse. No great change which involved the loss of intelligent hand labour was all for good. Granted that machinery was a necessity, those who employed it should be forced by public opinion, and through that by the law, not to make it a nuisance and to destroy by its fumes and smoke adjacent properties—trees, fruit, gardens, churches, cathedrals and what not. It would be said that a law which compelled the entire abolition of smoke would be

unpopular. No doubt it would be to a rich minority, but would be vastly popular to the majority. It was a sophism to say that such a law would be in restraint of trade. Westminster Abbey was fast decaying from effect upon its surface of coal smoke, and many of cathedrals were in a like plight. The Palace of Westminster itself was fast decaying, and yet we sat still. Parliament did anyhow, and let the evil go on. When the abominable demon of smoke was expelled—and it would be expelled—we determined that it should be—there would be gas on our house tops, trees in all our streets, fountains of silver water bubbling up in our squares. There would be squalor, less drink, more outdoor healthy life, greater sanitation and, above all, a happier people. Science taught yearly more and more of the importance of sunlight, when the man in the street was awake to that he would suffer himself to live in an atmosphere not fit for a human being, or under conditions of dirt against which his stomach should revolt, even at the risk of losing his employment, the money earner for a person or company. Light would give him his proper freedom, upon which as a man he had a right to insist.

Mr. W. Nicholson, sanitary inspector of Sheffield, he estimated that there was in the atmosphere over the islands daily thousands of tons of coal in the form of vapour and of the 150,000,000 tons of coal consumed annually in this country a third might be saved if a sensible and scientific scheme were adopted in the burning of the fuel. Owing to the crusade of the Smoke Abatement Association founded in Sheffield that city, which was formerly so much afflicted, had, owing to the adoption of drastic measures by the corporation, so improved that last year it had 1,437 hours of sunshine, or 368 more than Manchester, 367 more than Bradford, 265 more than Glasgow, 189 more than Leeds, 186 more than Birmingham, 158 more than Edinburgh, 53 hours more than York and 53 more than Bettws-y-Coed. There were several mechanical stokers and other apparatus intended to bring about perfect combustion, and he added that the law against smoke pollution was almost sufficient to bring about the required relief from the nuisance, provided it was properly enforced. He recommended, however, that the law, which now only prohibited "black smoke" should be made to apply also to every kind

visible smoke emitted from chimneys, and that domestic fires should be included. The smoke from dwelling-houses, he contended, was due to defects in combustion which might be overcome by the provision of proper grates and by the proper management of the fires.

Mr. Martin asked whether in the matter of smoke prevention the cure might not be worse than the disease. He heard of a case where a gentleman who, desiring that no part of his business should be a nuisance to his neighbours, put in at great expense a smoke-prevention apparatus and also an automatic stoker, but the result was that the air around the factory was charged with fine particles of coal dust, which found its way into the houses and made the neighbourhood more uncomfortable to live in than it was while the smoke was being given off from the chimney-stack.

Mr. Crowden asked whether it was not possible to diminish the smoke nuisance, without using expensive mechanical appliances, merely by having intelligent and painstaking stokers.

Mr. Lindley said that in Batley there were 100 tall chimneys, but the owner of three of the largest mills recently determined that the smoke nuisance should be abated and set the example himself, so that for the past three months his three chimneys had given off no more smoke than an ordinary house fire. There was no doubt that waste of fuel could be prevented by efficient firing, and if the manufacturers could only be convinced that smoke meant waste of fuel, besides shutting out the beautiful sunshine, there would soon be much less of it produced. At Llandudno the destructor was being worked in connection with the electric-light works; the whole of the day load of current for the electric tramway traction at Batley was derived from refuse consumed in the destructors in the morning.

Mr. Hilton pointed out that Liverpool dealt with the smoke nuisance under a special Act of Parliament, which defined the nuisance not as "black smoke," but as "excessive smoke." In Liverpool, too, it was not necessary to give any notice to offenders to abate the nuisance; a summons might be applied for at the first offence. In regard to the important matter of the education of stokers, some of the firms put on one side so much per week as a

premium, which was paid to the stoker as a reward should he so manage the fires that there was no nuisance. Inspectors generally might recommend that practice to the firms in their respective districts.

Mr. Davies (Little Hulton) remarked that the blue fumes which came from retorts were much more destructive to vegetation than black coal smoke. Could anything be done to prevent the mischief they caused?

Mr. Topping said it might be feasible to apply mechanical stokers or other mechanical means of smoke prevention to Lancashire cotton mills, where there was one chimney for a large number of boilers, but in a large iron-works there would be twelve to twenty separate furnaces delivering black smoke into the atmosphere. To apply mechanical appliances to each of these would mean a prohibitive expense.

Mr. Norton related that he issued a summons against a firm for emitting a large volume of black smoke. The manager said to him:—"Had I known what I know now I would have advised my directors not to put this mill in your district, but to take it over the border, where we should not have been troubled with smoke inspectors." That meant that his district was suffering because the authority were doing their duty, whilst other districts would benefit because they were not administering the Public Health Act in the way intended by the Legislature.

On Wednesday evening a serious fire broke out at the plate-glass factory of Messrs. Pilkington Bros., St. Helens, Lancashire. Messrs. Pilkington's two brigades, with the assistance of that belonging to the town, were enabled to confine the fire to the boiler-house and the dynamo-room, which are reported as destroyed. The loss will be a heavy one.

Mr. G. T. JELL, A.R.I.B.A., who for years has been chief of the staff to Mr. William Woodward, has commenced practice on his own account at Carlton House, Waterloo Place, S.W.

HYDE new secondary school, which is about to be erected, will be carried out from the designs and under the superintendence of Mr. G. H. Willoughby, F.R.I.B.A., of 48 Parr's Bank Buildings, York Street, Manchester.

## THE QUEBEC BRIDGE.

A DESCRIPTION in detail of the effect of the collapse of the great Quebec bridge appears in the *Engineering Record*, from which the following extracts are taken :—

At 5.30 P.M., August 29, the whole of the superstructure of the Quebec bridge so far erected collapsed without warning, and seventy-five of the eighty-six men known to be on it were killed. The substructure remained entirely uninjured. The superstructure was entirely wrecked and incredibly distorted. It lies on shore between the piers and under water in the river. The completed south anchor and cantilever arms, one-fourth of the suspended centre span, the centre span traveller, part of the main traveller, one locomotive and two material cars went down. The 215-foot south approach span is intact, and erection had not been commenced on the north half of the superstructure.

The wrecked portion weighed about 17,000 tons. But little of that on the river side of the main pier can be recovered. Most of the anchor arm eyebars have little or no injuries except bending; many are still perfect. Most connections endured when their members were destroyed. Nearly all parts of the structure fell 150 feet or more; some of them fell 400 feet. Many of the heaviest members were completely shattered and deformed by the fall.

No conditions or appearances have so far been observed that may not be satisfactorily attributed to the collapse—that is, nothing is indicative of cause rather than effect, and nothing yet points to the manner of the failure. Except the anchor arm eyebars, most of the truss members visible have been destroyed. Every failure visible can well be attributed to the collapse, and almost any one of them, if occurring before the general collapse, would have inevitably caused it.

All conditions were normal or more favourable than usual when a loud noise and screams were heard and immediately men on shore saw the end of the cantilever descend unbroken almost to the water's edge, the main traveller fall north and the 315-foot centre posts and the anchor arm collapse. Only one man, who was within 75 feet of the anch or pier, succeeded in reaching the approach span. Witnesses estimate the time from the noise till all was over from twenty to forty seconds. None of the witnesses was within several hundred feet, and none

of them, or of the survivors, has yet reported any details of the destruction, which was complete and almost instantaneous.

All the erection foremen were on the bridge, and all perished. They were A. B. Yenser, general foreman; J. L. Worley, foreman of erection; A. H. Birks, resident engineer for Phoenix Bridge Company; James W. Aderholdt, assistant foreman, and C. A. Meredith, rivetting foreman. Of the remaining victims, thirty-five were Indians from Montreal, mostly expert rivetters, twenty-nine were Canadians and the rest were experienced bridge men from the United States. All of the survivors are injured but are expected to recover.

The tremendous distortion and tearing apart of the members of the superstructure subjected the workmanship, design and materials to tests of the utmost severity, and in no case observed was there any indication of poor quality or defect.

Work had recently been somewhat delayed by a scarcity of workmen, and new men had been hired in the United States in accordance with a written agreement with a labour union which fixed their wages and paid their transportation to and from the bridge in case they worked through the season. Some of these men failed entirely to report at the bridge, and others, after working a short time, wished to quit and demanded their return fare. This was refused on account of their not having worked through to the end of the season as agreed, and in consequence a strike was declared. The old employés did not wish to lose time in the short working season on this account and the strike was soon declared off, but bitter feelings were said to exist a few days before the disaster.

At 5.30 P.M. all the erectors and their foremen and the engineer were on the bridge making everything secure for quitting at 5.45. Three four-men gangs of rivetters and one hoisting-engine man were on the anchor arm, and six gangs of rivetters were on the cantilever arm, the erecting gang was busy on the travellers and everything is believed to have been in normal condition. Mr. E. J. Wickzer, an experienced foreman who had been on this bridge three years in charge of the erection of falsework and travellers, was 1,200 feet or more away in the axis of the bridge on the north side of the river, where he was erecting the steel and wooden falsework.

for the anchor arm. He was watching the foremen directing the fitting of the splices on the 34-ton lower chord pieces still suspended from the traveller, when he heard a very loud noise like the report of a cannon or explosion and saw the end of the cantilever and centre span commence to descend, moving somewhat up and down stream as it did so. As it seemed to approach near the surface of the water the main traveller fell north, the main vertical posts collapsed and the entire structure instantly collapsed and disappeared, the whole taking but a few seconds. This account was corroborated by one of the workmen who was on the south shore about 500 feet west of the bridge and had his attention attracted by a loud explosion. He looked up and saw what seemed to him to be a cloud of smoke and saw the cantilever arm descend and the traveller fall before the collapse of the main post. Other accounts were substantially the same, but it was impossible to secure any statement from the survivors on the structure, who are rumoured to have said that rivet-heads flew off before the disaster.

All of the cantilever arm and suspended span, except a small part of the first panel of the cantilever which remains on top of the main pier, has disappeared under water, which rapidly deepens from nothing at low tide at the foot of the pier to 200 feet or more at the end of the cantilever arm, making it impossible to determine the position or condition of the trusses. The 315-foot main centre posts are each broken in several places, and have their feet on the ground on the south side of the main pier and their tops on the north side with the finials only projecting above the surface of the water. The anchor span, which, of course, was not self-supporting without the reactions from the cantilever span, and, owing to lack of compressive strength in its top chord, must have necessarily collapsed with the failure of the cantilever span, if not before, fell flat on the ground almost in its vertical plane, deviating laterally a surprisingly small amount. The bottom chords and some of the truss members projected in some places a few feet beyond the original planes of the trusses on both sides of the bridge, but the top chords in general moved a little east. There was no connection between the anchor arm and approach span except the four lines of track rails, three of which pulled off from the anchor arm and hung down vertically almost to the bottom of the pier, and the compressed air pipe which

pulled free at one connection near a long transverse arm without displacing the latter. The approach span remained entirely unaffected by the collapse. The anchor pier bent, 95½ feet high from top of masonry to roadway level, has two vertical posts which enclose the anchor eyebars and are 17 feet wide at the base parallel to the bridge axis. These revolved to the north about their lower ends to a position a little beyond the horizontal, and the trusses in collapsing moved still further north until the panel points up to eight (counting from the shore end) at least were 100 feet or more beyond their original positions.

The destruction and mutilation of members was most terrific on the main pier, across which fell the 3,000,000 lbs. vertical bent with 4 by 10 feet four-web vertical posts 315 feet high on centres with stresses of over 10,000,000 lbs. each. Each post was made in five sections and weighed 712,000 lbs., exclusive of the top and bottom pin connection pieces. They were connected by two massive plate girders and three deep lattice girders, all double. The foot of the east truss post, with its shoe and the V-shaped special lower chord section connected to it, fell on the shore side of the pier and formed one leg of a letter N, with the top of the other leg resting against and rising a few feet above the top of the pier, where it was broken through and separated 20 feet or more from the remainder of the post, which formed a letter V on the river side of the pier with the vertex under water and the finial, projecting 40 feet above the pier centre, emerging nearly horizontal and pointing north-east. A portion of the west truss main post extends horizontally across the pier obliquely, from about 1 to 4 feet clear of the east side of the west pedestal and 12 or 15 feet above the masonry. In the middle of this section two or three of the webs are broken through and at one end are rolled up close; the remaining one or two webs are continuous but very badly shattered and twisted. Beyond this place, on both sides of the pier, the lattice bars are destroyed and the post webs mashed up together and bent at right angles, connecting the horizontal part of the post with vertical parts on each side of the pier. The wide, thick web plates and 8-inch flange angles are shattered, twisted and broken, and look like rags. Between the bolsters the twisted and torn steelwork is piled up in a jagged mass about 20 feet high above the bolster tops. In the upper

part of the wreckage lie the top chords, still connected, and displaced transversely about 8 feet east of their original positions.

Throughout the wreck the eyebars and all connections, except those of the lower chords which were subjected to shearing conditions in the pits, endured remarkably well, but the latticing, even when made with well-riveted large angles, as in the main posts and chords, broke and sheared its rivets in many places, failing to develop the compressive strength of the webs and allowing them to buckle and twist between tieplates where, as a rule, they retained their original cross section. It was observed that in most cases where plates and angles were sheared it was through the rivet holes. In numberless cases very thick plates and angles were sheared, twisted, curled and bent at sharp angles, and their behaviour and the texture of the fracture invariably indicated high-grade steel in which no sign of flaw or other defect was anywhere observed.

That anybody on the bridge should have escaped alive is miraculous, when it is considered that the least distance any part fell was over 150 feet, and that some of them fell over 400 feet, the bulk falling over 150 feet. Notwithstanding, eleven of the men who went down with the steelwork escaped alive, and will probably recover from their injuries. Two brothers were rivetting at the top of post P<sub>1</sub>, over 200 feet above the rocky ground; one was inside the post and the other inside the transverse strut, both holding on rivets. The massive post was bent, crumpled and torn to pieces, and the men escaped. Another rivetter who was also holding on inside the lower chord near the main pier, more than 50 feet above the ground, went down in it and emerged alive. One man on top of the main traveller fell with it about 400 feet into the water and was rescued; another on top of the small traveller fell about 250 feet into the water and was also rescued.

The Canadian Government has appointed a commission composed of Mr. H. Holgate and Mr. Kerry, of Montreal, and Professor Galbraith, of Toronto, to investigate the accident, and every effort is being made by the Quebec Bridge Company and the Phoenix Bridge Company to determine the cause of the disaster and fix the responsibility where it belongs, regardless of who may be at fault. No

facts have been concealed, and every facility was extended for the examination from which these notes have been prepared.

### AN IMAGINARY GRIEVANCE.

It may be remembered that some months back there were allegations about the indifference to have specifications for heating apparatus properly carried out in two of the Board schools of Dundee. During the vacation Mr. Thomas Young, a consulting engineer, was commissioned to examine and test the installation. The following is his report:—

#### *Ancrum Road School.*

In terms of remit, I again visited this school on June 28, 1907, and had the whole of the work measured as actually carried out by Messrs. A. L. Peacock & Co., heating contractors, Dundee. The complete measurement amounts to 864*l.* 3*s.* 7½*d.* Of this amount 165*l.* 13*s.* 3½*d.* is for extra items outside the original heating contract, thus leaving the sum of 698*l.* 10*s.* 4*d.* for the heating contract. The quantities of materials are greatly in excess of what was allowed in the original specification, which accounts for the above amounts. With reference to the following complaints:—

1. Whether a single or double-pipe system has been installed.—There is no question but that a single-pipe system has been installed.

2. That cast-iron tees, bends and connections have been supplied instead of wrought-iron.—The bulk of the tees, bends, &c., used are of cast-iron and not wrought-iron, as specified. I have priced these at cast-iron rates.

3. That cheaper radiators than those specified have been supplied.—A cheaper and different kind of radiator has been used in the air ducts or flues. A greater number, however, have been installed, which brings up the total price to within 1*l.* of those specified.

4. That cheaper valves have been used, and that piping supplied is not the specified size.—The valves specified have been used as far as possible. Those for controlling the radiators in rooms had to be made of a special design, and are more costly than those specified. The dimensions of piping have been altered to suit the installation.

### THE "ZETA" WOOD FLOORING CO. LTD

CRISPIN'S WHARF, MARSHGATE LANE, STRATFORD, E.  
CITY OFFICE: 28 FENCHURCH STREET, LONDON, E.C.

5. That the following items in specification have not been supplied :—One Evans power pump, belting,  $\frac{1}{2}$  h.p. Crompton motor, three batteries of sanitary pin radiators.—It is true that the above have not been supplied, the architect having considered that these were not necessary. The sum allowed for these items in the tender was 16*l.* 5*s.* Should these be required at a future date they would cost the Board 53*l.*

6. Messrs. Peacock's tender amounted to . £725 0 0  
Deducting the items not supplied,  
pumps, &c. . . . . 16 5 0

Leaving . . . . . £708 15 0

The heating contract has been completed for the sum of 698*l.* 10*s.* 4*d.* This amount included a large number of items not provided for in the original specification. The other items which go to make up the additional 165*l.* 13*s.* 3½*d.* are :—Hat and coat rails, pegs, copper coils and piping for hot water, radiator basis, marble tops, chequered flooring-plates, hire of temporary electric motor, &c.

7. The contract stipulates that the work must be done to the entire satisfaction of the architect. This has been done by the acceptance of the work and materials as carried out, and further that the Board have already expressed themselves satisfied with the architect's explanations. In conclusion I may state that the Board have got a good and cheap installation, and that they are only paying for the quantity and quality of materials supplied.

*Harris Academy.*

As instructed I visited this school on Tuesday, June 4, and made an examination of the heating installation as carried out by Messrs. A. L. Peacock & Co., and remeasurement prepared by Mr. Langlands, architect. Regarding the complaints made, the following summary deals with the points raised :—

1. That a single-pipe system has been erected instead of a double-pipe system, specified in schedule.—The system as carried out is what is known as the single-pipe system, having flow and return mains with single riser to each radiator. The actual quantity of piping, valves, &c., used in carrying out the work has been charged and paid for.

2. That the radiators specified have not been supplied.—The radiators used cost per square foot of heating surface more than those specified.

3. That ordinary asbestos covering on the mains has been used in place of moulded asbestos covering.—Ordinary asbestos covering applied in a plastic state has been used for covering the piping, instead of the moulded asbestos covering specified. This would cost 1*d.* per square foot less than the moulded covering. The plastic covering, so far as efficiency in this installation is concerned, is equal to the moulded covering.

4. That fittings of cast-iron instead of steam quality wrought-iron have been supplied.—Wrought-iron piping has been used throughout, but cast-iron bends, tees, &c., have been used. Although the term "steam quality" is mentioned in the specification, no mention is made as to whether the steam quality refers to wrought-iron or cast-iron. The contractors were therefore entitled to use cast-iron connections provided they were of steam quality. These cast-iron fittings are universally used on the Continent, in America and in this country for similar heating installations.

5. I enclose new measurement, which brings out the total for work done by Messrs. Peacock at 239*l.* 12*s.* 4*d.* They have been paid 245*l.* 13*s.* 3*d.*

6. I consider the Board have got a good installation at a low figure, the materials and workmanship being of high-class quality.

A NEW PROTECTIVE COVERING.

A PAPER was read by Mr. F. J. R. Carulla (Derby) on "A New Blue-black Iron Paint as a Protective Covering" at the Iron and Steel Congress at Vienna.

In the preparation of iron and steel rods for wire-drawing and galvanising, as also in the preparation of plates for tinning, &c., the iron, he said, is kept for a time in a bath of acid to remove the scale. The acid used may be sulphuric acid, when a solution of sulphate of iron (copperas) is produced ; or hydrochloric acid may be employed, when a solution of chloride of iron is obtained.

A number of methods have been devised to utilise these solutions, and it is the object of this paper to bring before

you the one which appears to be the most valuable when chloride liquors have to be dealt with.

The acids named are not absolutely neutralised by the use that they are put to, so that the liquors are still active, and have to be "killed" before they are subjected to any operation for the recovery of the iron and of the acid in any form.

The sulphate "waste pickle" liquors, as they are termed, are killed or neutralised by the addition of scrap, producing a neutral solution from which copperas in the solid form is obtained, these liquors being one of the main sources of this material. When hydrochloric acid is employed, ferrous chloride is produced, which is not so tractable a salt as the sulphate, owing to its great solubility; and, besides, the demand for it is insignificant when compared with that for sulphate.

The chloride liquors are consequently generally dealt with by adding some base, which, combining with the chlorine, will precipitate the iron as an oxide, and that which naturally suggests itself is lime. This has been employed; but the calcium produced being also a very soluble and deliquescent substance, with little use for it, the process can only be resorted to as a necessity.

The idea occurred to Dr. C. F. Wulffing, for some time a resident in the Swansea tinplate district, that ammonia might be employed to effect the precipitation in question, seeing that the value of the ammonium chloride is greater than that of the ammonia employed.

The great drawback to such a process naturally is that the volatile nature of ammonia requires special attention to be given to the apparatus employed, which must necessarily be closed, and every possible means of escape of the ammonia prevented. Especially is this the case as the liquor has to be blown for a considerable period in the presence of ammonia, some of which the air carries off, and provision has to be made in the plant not to lose this ammonia.

"The necessity for this blowing or oxidation arises from the fact that Dr. Wulffing's main object is to obtain a black oxide of iron, which is only produced after long exposure to the air blast. This oxide, which is obtained as a beautiful blue-black colour, is quite insoluble in water, and when passed into the filter-press leaves a clear solution of

ammonium chloride, which is evaporated and allowed to crystallise."

The blue-black precipitate was magnetic and a valuable addition to the list of pigments that could be employed with advantage for the protection of structural ironwork.

By similarly treating the chloride liquors with other bases a black colour could be obtained, but it was not of the extreme fineness possessed by the substances when ammonia was employed. It was also necessary to consider that absolute chemical purity was unattainable whatever method might be employed. If the process was attempted with lime, some of this, which was a most undesirable impurity, remained behind, the colour produced being besides of poor quality. With ammonia, on the other hand, the black oxide was left with a trace of a double salt. This acted beneficially on the paint, although ammonium chloride by itself would not do so. Structures that had been painted with this blue-black oxide of iron (boiled linseed oil being used in the preparation of the paint) had kept fresh, though exposed to the weather, for nearly two years, still showing a varnish-like surface.

The Sharon Chemical Co., Ltd., to whom Dr. Wulffing had assigned the English patent, were putting up a plant in Derby.

THE Birmingham Board of Guardians have received the sanction of the Local Government Board for borrowing 16,594*l.* for the Guardians' portion of the cost of erecting buildings for epileptic and feeble-minded persons at Monyhull Hall.

On Saturday it transpired that the Ammonia Soda Company intend to erect a large chemical works at Plumbley, near Northwich, at an early date. Boring operations for brine were successful, and the brine shaft recently completed is 7 feet by 7 feet 6 inches and 293 feet deep. It is claimed that the brine is abundant, of the best possible quality and rises to within 60 feet of the surface. It has been tested by a powerful pump and is declared to be inexhaustible. The estate has been taken over by the above company, and some of the contracts for the works have already been let.

\*\* As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

**COMPETITIONS OPEN.**

BOOTLE (LANCS).—Jan. 31.—The Bootle education committee invite designs for a public elementary school for 1,000 children. Conditions and particulars may be obtained from Mr. J. Henry Farmer, town clerk, Town Hall, Bootle.

CEMAES.—Oct. 15.—The Twrc-lyn Rural District Council invite plans and specifications for a drainage scheme for the village of Cemaes, Anglesey. Competitors are requested to state the remuneration required by them for the plans, specifications and supervision of the work. Mr. Thomas Hughes, clerk, Brynaethwy, Menai Bridge.

DOVER.—Oct. 14.—The committee of the Dover pageant, July 27 to August 1, 1908, invite coloured designs for a suitable double-royal poster (40 inches by 25 inches). There should be some indication of the sea, a ship and Dover as the key of England. Prizes of 10l., 2l. 10s. and 1l. are offered. The prize-winning designs will become the absolute property of the committee. The Secretary, Pageant House, Dover.

LONDON.—Oct. 14.—The Acton District Council invite architects who have been in practice for at least seven years to send in to Mr. Wm. Hodson, clerk, 242 High Street, Acton, W., before Oct. 14, designs for erection of the proposed Council offices, at a cost not exceeding 18,000l. An assessor will be appointed, and premiums of 100 guineas, 50 guineas and 25 guineas will be awarded for the designs selected by the Council after their consideration of the assessor's award. Particulars can be obtained upon the payment of 10s. 6d.

**CONTRACTS OPEN.**

THE Earl of Mansfield is having his mansion at Ker Wood, adjoining Hampstead Heath, lighted by electricity. A contract has been entered into with the Hampstead Borough Council for the purpose, and electricians are engaged on the installation, which is said to be one of the largest ever undertaken in connection with a private residence in or near London. In this case the electric light is directly to supersede the use of wax candles.

TRADE NOTES.

THE contract for the entire warming, ventilation, hot and cold-water supplies and fire mains for the extensions to the Staffordshire county asylum, near Leek, has been placed in the hands of the Brightside Foundry and Engineering Company, Ltd., of Sheffield and London.

A BOOKLET, which is a typographical gem and worth preserving for its execution, has been issued by Messrs. Robert Boyle & Son. It contains numerous testimonies by experts to the qualities of their natural system of ventilation.

MESSRS. WM. POTTS & SONS, of Leeds and Newcastle-on-Tyne, have received instructions to make and fix a large Cambridge quarter-chime clock for the Abbey Church, Monkton Priors, Pembrokeshire, South Wales.

MESSRS. OETZMANN & Co., LTD., have supplied the whole of the stage furnishing for the series of French plays at the New Royalty Theatre for the season which commenced on the 2nd inst. The scenes will sustain comparison with the setting of the Paris theatres.

THE De Laitte Gas Machine Syndicate, Ltd., of 117 Middlesex Street, London, E., have within the past fortnight supplied large De Laitte machines both for the Lancashire and Yorkshire Railway and the Bombay and Baroda Railways.

UNDER the direction of Messrs. Greenhalgh & Brockbank, architects, Southend-on-Sea, the "Boyle" natural system of ventilation, embracing the latest patent "air-pump" ventilators, has been applied to the Bournemouthe Park Road schools, Southend-on-Sea.

THE whole of the stonework for St. Simon's Church, Plymouth, was prepared in the masons' shops of the Bath Stone Firms, Ltd. It is built of St. Aldhelm Box-ground stone for the outside, Monk's Park for the interior and corngrit for the columns. The architect is Mr. Harbottle Reed, of Exeter, and the builders Messrs. Pethick Bros., of Plymouth.

"BUSINESS MAGNETS" is the title of a new catalogue issued by Parnall & Sons, Ltd., Bristol. This is a well-known house as manufacturers of shop fronts and fittings, weighing apparatus and general trade utensils, but the present catalogue is devoted to illustrations of illuminated signs and other advertising novelties calculated to arrest attention and bring trade. Copies can be had free on application from either their registered offices in Bristol, their London offices, 10 Rood Lane, E.C., or from their Swansea address, 12 Alexandra Road.

IN confirmation of our remarks last week concerning the excellence of the "Hatfield" pump, we have received from Messrs. Merryweather & Sons, Ltd., the makers, a copy of a testimonial respecting the same, and the ap-

Illustrated Sheet, showing application of our Hot Water Cylindrical Tanks, sent on request.

# Technical Literature

A Monthly Review, Guide, and Classified Index of all that is vital and best in the world's technical literature, whether presented in the form of books, articles, proceedings of learned societies, lectures, or even trade pamphlets. Also contains original contributions by eminent professional men and writers on Technology, which reflect the progress and developments in the various fields of technical work.

The Classified Index of Technical Articles in current periodical literature extends to 32 pages each month, and is of the utmost value to all professional men.

"TECHNICAL LITERATURE" commenced in January last, and has met with so large a measure of success that very few sets of Nos. 1-4 are available. Those who desire a complete set should order forthwith.

Price 10s. 6d. a year, post free. Single copies, 1s., post free.

Prospectus of this and other technical publications post free on application to

Ludgate Circus, London, E.C.

pliances supplied to the Western Counties Asylum, Star-cross, near Exeter, sent to them a few days ago by the secretary. It says:—"The fire-extinguishing appliances, hydrants, &c., installed by you at this institution some eight years since have proved satisfactory in every respect, and, although used regularly for practice purposes, have never yet got out of order. I cannot speak too highly of the 'Hatfield' pump which, driven by a stationary gas-engine, is used as a fire-engine and also for pumping the daily supply of water to the top of the building. The triple-barrel arrangement of the pumps and short stroke insures a steady flow of water, whilst the engine has worked smoothly and well and has cost nothing for repairs."

An important combination of structural engineering works has been effected by the purchase and incorporation by Messrs. A. & J. Main & Co., Ltd., Clydesdale Iron Works, Possilpark, Glasgow, of Arrol's Bridge and Roof Works, Germiston, Glasgow. The necessity for a large extension to their productive capacity has been forced on Messrs. Main & Co. by the continued expansion of their business in all parts of the world where steel and iron buildings find a market, and also to enable them to cope thoroughly with the demand for the heavier class of bridge and girderwork, for which the Germiston works have been laid out and equipped. The additional facilities now added to Messrs. A. & J. Main's capacity for dealing with the requirements in structural steel construction may be indicated by a mention of some of the important contracts executed by the Arrol Bridge and Roof Works, viz.:—The Connel Ferry railway bridge, 500 feet cantilever span, over Loch Eive; Widnes and Runcorn transporter bridge, 1,000 feet span, over river Mersey and Manchester Ship Canal; Waverley Bridge and station entrances, Edinburgh; Liffey Viaduct, Dublin. The services of the chief men of Messrs. Arrol's technical and works staff are being retained by Messrs. Main, and the combined businesses will be dealt with by the existing offices, branches and agencies of Messrs. A. & J. Main & Co., Ltd., at home and abroad.

THE Council of the Society of British Gas Industries announce that Sir George Livesey has accepted the presidency of the Society for next year.

### CHEMICALS AND FIRE EXTINCTION.

It must be allowed that there is a prejudice more or less general about the efficiency of chemicals in overcoming fires. That may explain why no less than eighteen tests with several re-tests were gone through by the British Fire Prevention Committee in order to ascertain the value of the "Minimax" extinguishers. The apparatus consists of a vessel in the form of a long cone made of sheet steel and coated with lead. Within it is an exit tube for conveying the jet through the aperture of the nozzle. There is also a metal cage within which is a glass tube hermetically sealed containing acid. In addition is a plunger, which on receiving a blow shatters the glass tube, when the acid combines with the bicarbonate of soda in solution, with which the apparatus is filled. There is no difficulty in quickly setting the appliance in action. The committee employed in their tests materials which are easily ignited, such as hay, loose wool, inflammable materials, wood laths, shavings, celluloid, petrol, vapour, &c. The results in each case are described in red book No. 121, but the following is a summary of the results:—

"The tests demonstrated that the extinguishers brought into action were uniformly efficient in checking a small fire in its early stages, whether applied by parties inexperienced in their use or by parties having expert knowledge of their application (*i.e.* by nominees of the committee or nominees of the testor). In several instances one appliance sufficed to completely extinguish a small fire. Where the material ignited was soft and loose great difficulty was apparent in stopping the smouldering which ensued, the flames, however, being held in check."

It may therefore be concluded that the "Minimax" extinguisher is worthy of reliance, and as such would be a helpful auxiliary in houses, manufactories and stores.

### AN ADAPTOR FOR HYDRANTS.

ANYONE who has observed what takes place at a fire is aware that the members of a fire-brigade require much steadiness, coolness and practice before they are able to make water control the flames. This arises from the excitement of the people who are quickly gathered and who

various ways impede instead of aiding the men who have to carry on the combat. With amateurs the preliminary arrangements become still more difficult. And on account wherever apparatus exist for extinguishing fires the men who are likely to take part in the operations should be regularly drilled. Messrs. Featherstone & Co. have invented an automatic adaptor which will facilitate the action of the water and will prevent the confusion which often arises in dealing with a long line of hose. The tests which were carried out in June and July by the British Fire Prevention Committee have been described in the official report. They were made with hydrants fitted with adaptors and hydrants without adaptors, the other conditions being alike. In one case the water acted when the adaptor was closed 8 seconds sooner than with a hydrant alone. In another case there was a difference of 29 seconds. In a third case the difference was 9 seconds. The committee say that "the hydrant adaptors in each case were found to open the valves when the hose was pulled, irrespective of distance, direction and run of hose, and in the major number of the tests it was found that the water could be obtained at the branch more rapidly when the valve was opened by the adaptor than when the ordinary screw-down valve was opened after the hose was run out." By the use of the adaptor any hydrant, cock, or tap may become automatic. As there is no necessity for unscrewing, it is adapted to give confidence and to conquer the nervousness most inevitable when amateurs attempt to grapple with a fire.

## VARIETIES.

THE Preston Town Council, by twenty-nine votes to ten, decided to increase the salary of Mr. James Barron, Ribblesdale engineer, from 450*l.* to 500*l.*

MESSRS. PATMAN & FOTHERINGHAM, LTD., have secured the contract for alterations and additions to be made at 100 and 102 Theobald's Road, W.C., for the Daimler Motor Car Company. Messrs. Briant & Sons are the architects.

THE demand for houses on the estate of the Hampstead Tenants, Ltd., is such that all the houses that can be erected by the company during the next eighteen months have already been taken.

THE Local Government Board has sanctioned the application of the Belfast Corporation for a loan of 75,000*l.* for the purpose of providing additional plant and meters and making extensions in connection with the electric-lighting system of the city.

EXTENSIVE alterations are being carried out at the London Road Girls' school, Southend, for the Southend education committee, from plans prepared by Messrs. Cabuche & Hayward, architects, of Westcliff. Messrs. Jay & Co. are the builders.

THE contract for the erection of a Grammar school for Wirksworth has been let to Messrs. G. Walker & Sons, of Wirksworth. The amount of the contract is over 4,000*l.* The new building is to supersede the present ancient Grammar school. The work will be commenced shortly.

IMPORTANT alterations and improvements in the winter-train service from London to the West of England are announced by the London and South-Western Railway Company, commencing on the 1st inst. Many important changes will also be effected in the South of England service to Bournemouth, Weymouth, &c.

At a meeting of the Warwick Rural District Council held on Saturday plans were informally presented of the proposed Trafford Garden City at Hatton. The scheme contemplates the use of 150 or 200 acres of land having direct access to Hatton station. It is proposed to build seventy-one houses, with church, chapel, hotel, sports ground, dingle and institute.

# REINFORCED CONCRETE

## SOME OPINIONS ON THE KAHN BAR.

**Municipal Office, \_\_\_\_\_, India.**

"It appears to me that the Kahn Bar is indispensable for concrete construction."

**Papers of the Corps of Royal Engineers.**

"We see therefore that this bar possesses points of importance, and though it is possible to make efficient reinforced concrete without having resort to these special bars, there is no doubt that their use gives one an added confidence."

*If more reasons are needed before using Kahn Bars in your Building, send for a copy of Handbook to*

**THE TRUSSED CONCRETE STEEL CO., Ltd.,**

**53 CAXTON HOUSE, WESTMINSTER, S.W.**

## IRON AND STEEL.

MESSRS. HALL & PICKLES, of Manchester, have brought out a new edition of their stock catalogue comprising all varieties of iron and steel used in construction—flats, squares, rounds, girders, joists, rails, &c. One great advantage is that code words are given for each variety, and they are arranged in a way which will facilitate reference. At least one-half of the book is occupied with tables showing the safe loads for various spans of rolled joists, broad flanged and ordinary beams, compound girders, stanchions, &c. The data on which the figures are based are given, and an architect or engineer can without difficulty ascertain whether the loads may be increased or should be diminished. It is a handy volume, well printed and strongly bound. Illustrations are given of the immense and fully-stocked warehouse of the firm in Manchester.

## THE ENGINEERING EXHIBITION.

THE general interest in the large display gathered together at Olympia continues to increase. Ladies as well as gentlemen are eager for explanations, and listen attentively to the details of complex machines explained to them by the attendants at the stands. A very interesting display of drawings and photographs is shown at the Kilowatt Publishing Company's kiosk. Of course, the main features of the Exhibition are, as we have already said, mainly concerned with engineering, but there is yet much to interest the architect. In an array of appliances of this character the larger exhibits are rather apt to overshadow those of less magnitude. It is often the case, however, that contrivances in the smaller displays present more novelty, and are of more service as suggesting ideas, than are the established pieces of mechanism shown on the greater scale. At Olympia, therefore, attention should be directed to these unpretentious, but equally important, exhibits. In our selection it must not be thought that it is made in any invidious manner; when so much claims the attention the most that can be hoped for is a brief description of a few exhibits.

The Pulsometer Engineering Company, Ltd., Reading and London, are showing one of their No. 12 patent Pulsometer steam pumps. This pump, although only 10 feet 6 inches

high, is capable of throwing 150,000 gallons per hour. In order to emphasise the great range of pumps that company make, there are two No. 1 Pulsometer pump close proximity to the No. 12. These little pumps, which are only 17 inches high, have an output of 1,000 gallons per hour. Every size of pump from the largest to the smallest will work suspended on a chain, and requiring no fixing, can be put to work in the minimum of time. Pulsometer Engineering Company have increased the height to which these pumps will deliver, and are selling them at work on 150 feet vertical in single lifts. Two or more pumps can be placed in series the range of heights reached by these pumps is now very great.

Messrs. Murray, Lotz & Co. display a model of the Phoenix patent system, which has been specially designed to reduce the cost of wood construction and to enable wooden structures to be erected expeditiously and without the necessity of employing expensive labour. Buildings and erections executed on this system have a rigidity and durability practically equal to the more expensive steel construction. The connections greatly simplify the general construction and entirely obviate the tedious and costly work of mortising and tenoning the wood. The Phoenix patent connection of the upright standard to its foundation gives the building a stability unapproached in any other wood construction. This not only greatly strengthens the building, but effectively prevents decay through the rotting of the uprights at the point of contact with the ground and makes it possible to utilise cheaper qualities of wood without fear of rapid deterioration. Tenoning and mortising are entirely dispensed with, and as the whole work of preparation consists of cutting the wood to length and boring the bolt holes, it can easily be carried out by ordinary unskilled labourers under the supervision of one capable of ordinary intelligence. When the iron foot connections are once embedded in their foundations and the wood is to length, large portions of the buildings are screwed together on the ground, and with the standards held in position around the lower bolt of the foundation uprights the whole is raised into vertical position with little difficulty. The parts thus erected form in themselves all the necessary scaffolding for fitting up the roof and completing the building. A number of photographs of the Hunt elevating

## THE WOOD CARVING

Windsor St.,  
**BIRMINGHAM.**

BALUSTERS, NEWELS,  
OVERDOORS, and CARVING  
of every description.

WRITE FOR ILLUSTRATED L

supporting machinery, industrial railways, &c., for which they are the agents in Britain, are also shown. This machinery, especially the industrial railways and the lifting and discharging bridges, are now very much used, and have proved themselves under all circumstances roughly efficient.

A very important stand is that of *Messrs. Arthur L. & Co.*, of Tower Street, Upper St. Martin's Lane. The well-known specialties of the firm are on view at their stand, which is a centre of interest to architects and engineers. The Kinnear patent steel-rolling shutters, which are shown by them, have a salient feature, distinguishing them from all other shutters, in that the slats are made out of light sheet-steel, the section being designed to give the maximum strength and rigidity with the least possible weight, while forming in the slats themselves an interlocking hinge throughout their length; no hinges apart from the slats themselves being required. Single shutters may be made up to 40 feet in width and any height. A complete shutter is shown fixed at the stand, giving netting 16 feet high by 12 feet wide. The pressed radiators, under the same name, instead of being cast, are pressed of thin sheet metal, specially designed machinery being used to form and join up the sections. As they are of thin metal they produce heat much quicker than cast-iron, occupy half the floor space, weigh less than one-fourth and require only half the volume of water or steam. Those who follow American and Canadian business need not be reminded of the virtues of Cabot's productions. Their rattling and sound-deadening quilt prevents the transmission of sound through walls and floors, and is equally effective as an insulator, keeping out heat and cold. The same house has also creosote stains for exterior woodwork. These give rich colouring effects, and are an excellent preservative of wood. In all other or minor articles for the building trade an extensive variety and assortment is shown. The Burt ventilator is shown in two forms—one with metal top, and the other with glass, making the ventilator an efficient skylight. An important feature is the patent sliding sleeve damper, which ensures that the main shaft to ventilator is always open and unobstructed. The "Crescent" patent expansion bolt is also shown. It is for fastening ironwork to masonry, wood

or brickwork, and gives the strongest possible fixing with less labour than is required where ordinary Lewis bolts are used. The B. & S. patent folding gate is of the collapsible type, but having special features peculiar to itself, which insure the even distribution of pressure applied at any point to open or close the gate. A patent interlocking rubber tiling is exhibited on the floor of the stand. This is noiseless, non-slippery, waterproof and thoroughly sanitary, a solid rubber floor, unlimited in size or shape, having all the durability of the hard tile without its liability to damp. It is a well-devised and interesting display.

Non-explosive air-gas made under the patents of Mr. Cox and protected all over the world is an illuminant of especial value in country houses and institutions, or in all districts where coal-gas is not available. The patent machine produces gas at less than one penny per thousand candle-power per hour. It is absolutely smokeless, odourless, non-corrosive and non-poisonous; quite harmless to ceilings, pictures, furniture, &c., and is pure—a point of great importance to those of delicate constitution who breathe the air of the place illuminated by it. The plant is available for cooking and heating, as well as for lighting, and is easy to work, requiring no skilled labour even to install, and little attention while in operation. The air-gas produced is perfectly safe, and cannot explode or ignite. The principle of the apparatus is providing a mechanical appliance most ingenious. It consists in saturating the ordinary atmosphere with the vapour of a light hydrocarbon, such as petrol, which is in very general use just now, being required in the running of motor cars and purchasable in nearly every district. A small rotary pump is the means employed; this forces the air through a carburetter, in which is an appliance which forces small quantities over a large area, and has also means of regulating the supply and pressure of air and petrol in a uniform manner, and obviates the bugbear of this class of appliance, evaporation and condensation. It appears to us a most useful appliance, by no means large for its work, well devised, and one which will be found specially useful in country houses or in rural districts. The absolutely harmless nature of the apparatus may be gleaned from the fact that Cox's non-explosive air-gas plants are allowed by the insurance company without extra premiums.

### The "MASTA" Patent Improved

## PARTITION BLOCKS AND CEILING SLABS

Are manufactured chiefly of Stourbridge Fireclay, making them absolutely **Fireproof and Sound-proof**, and **Exceptionally Light in Weight**. **Fibrous Ceilings** made of same material.

### EXTRUDED BARS

(ALEXANDER DICK'S PATENTS)

In BRASS, BRONZE, and other Alloys.

**THE DELTA METAL CO., LTD.**  
EAST GREENWICH,  
LONDON, S.E.

An appliance that will interest the architect particularly is the exhibit of the *Linolite Company*, of Westminster. Their specialty is Tubolite (Tube o' Light), which is a practically continuous straight line of incandescent carbon filament of the usual and well-tried type. The filament is contained, in lengths of about  $8\frac{1}{2}$  inches, in straight glass tubes,  $\frac{7}{8}$  inch in diameter, having one terminal at each end. The standard lamp is 12 c.p. (more would be wasteful, on account of the efficiency of the system), taking 3.75 watts per c.p., and has an average life of 1,000 hours, with a decrease of only 14.5 per cent. of the light in that time. The lamps are placed end to end in a semicircular, channel-shaped, highly-polished aluminium reflector,  $2\frac{1}{4}$  inches wide by 1 inch deep, having an efficiency of 81 per cent., compared with 92 per cent., the efficiency of highly-polished silver, the most nearly perfect (though too expensive) reflector there is. The two edges of the reflector are rolled into small beads, each of which carries one of the wires, which are thus protected from injury. The lamps are held firmly, and in the position for maximum efficiency, in the reflector by aluminium holders, having centre contact plungers.

The light is distributed over an angle of  $140^\circ$  degs. Throughout half of this angle the light is from two to two and a half times as great as the candle-power marked on the lamp, and for  $100^\circ$  degs. it is 50 per cent. to 150 per cent. greater. Compared with an ordinary bulb lamp, fitted with a cone-shaped opal reflector, "Tubolite" throws 57 per cent. more light on to an area 12 feet in diameter for the same expenditure of energy.

The *Colchester Lathe Company*, Hythe, Colchester, show a large selection of high-speed lathes, of latest and improved patterns, in motion. *Cochran & Co., Ltd.*, of Annan (N.B.), have at their stall hand-painted diagrams, photographs and other pictures, illustrating the Cochran patent vertical multitubular boiler. The entire stand is designed to draw attention to the various points of interest in the Cochran type of boiler itself, and also to illustrate various modifications which have been made to suit the type of boiler to different purposes. The *Adjustable Cover and Boiler Block Company, Ltd.*, of 64 Victoria Street, S.W., have a model of a Lancashire boiler, showing the adjustable system of setting with their overlapping seating blocks and removable covers, and those for the minor walls, which method they

claim to be unequalled for effecting economy of efficiency and facility for inspection, with but little inconvenience for properly preparing boiler.

The *Fairbanks Company*, of City Road, E.C., exhibit Yale and Towne electric hoist, which can be hung in position, being suspended from a single hook in the same manner as an ordinary pulley block, and current can be obtained from an ordinary pair of lamp wires; also Yale and Towne triplex blocks, power applied through gears, reducing friction to a minimum, and giving high speed and great efficiency. Separate self-sustaining mechanism, simple and safe, having great advantages of ordinary types, most of these depending on friction which acts against the hoisting of the load as well as preventing from running down. A large number of various exhibits were also gathered together at this stand.

Considerable interest clustered around the stand of *Consolidated Pneumatic Tool Company, Ltd.*, of Pall Mall Chambers, 9 Bridge Street, Westminster, a purely technical exhibit, where in action were shown Boyer and Keller hammers for both stone and metal; Boyer, Keller, "Little Giant" and Whitelaw drills for drilling in metal, tapping, expanding and cutting, reaming, tapping, &c., pneumatic grinder and polisher, air-compressor and receiver, together with all hose pipes, connections, accessories necessary showing the several classes of machines under full working conditions.

*Messrs. L. Sterne & Co., Ltd.*, of Glasgow, London and Paris, exhibit a small cold chamber. The temperature of the room is cooled by one of their "C" type enclosed refrigerating and ice-making machines. The system employed is cold air circulation, the air being forced over cold pipes by means of an electrically-driven fan, simply regulating the "expansion valve" any required temperature can be obtained. Also a self-contained plant (for making 300 lbs. of ice per day of twenty-four hours). This plant is provided with one of their "A" type enclosed refrigerating and ice-making machines. It is supplied complete and is extremely simple to operate. The patent Sterne-Dubern ice-making apparatus enables clear hard ice to be made from ordinary water by rotary agitation. When opaque ice only is required it does not necessitate the rotary agitators.

TORNADO RISKS.

The following classification and rates of the various tornado risks on the South Atlantic seaboard (Maryland to Texas) have been promulgated by the American insurance companies:—

Classes.	Rates.
Buildings in course of construction—frame or iron-clad . . . . .	\$1 00
Buildings in course of construction—brick . . . . .	75
Fertiliser and phosphate plants, including phosphate mining plants . . . . .	1 00
Smoke stacks—iron—amount not to exceed 5 per cent. of schedule . . . . .	1 00
Tobacco prize-ries and stemmeries, buildings and machinery—brick . . . . .	25
Stock—brick . . . . .	50
Prizeries, warehouses, factories, stemmeries and barns—buildings and machinery—frame or iron-clad . . . . .	75
Stock . . . . .	1 00
Cotton gins—frame or iron-clad . . . . .	50
Churches—with steeples . . . . .	50
Churches—without steeples . . . . .	25
Standing timber—Limit per acre. Minimum claim to be ten times said limit . . . . .	50
Sugar houses . . . . .	50
Mercantile stocks . . . . .	25
Grain elevators, frame or iron-clad flour mills, all cotton compresses and sheds, resort hotels, rice mills, terminal or wharf sheds, and generally buildings of large open area, 7,500 square feet or over, and contents of same . . . . .	40
Cotton-seed houses and hull houses . . . . .	40
All other classes . . . . .	20

STEYNING CHURCH.

The improvements and reinstatements—for that much used word “restoration” does not fairly describe the work which is being done—at Steyning parish church are making great progress. It is now possible, says the *Sussex Daily News*, to see the full beauty of the noble Norman

arcade, for nearly a generation defaced and hidden by the heavy galleries. The south doorway, the upper part of which was blocked, has been opened up to the crown of the arch, and although this alteration shows conclusively that the Norman moulded frame with beakhead ornament is only a frame brought evidently from some other position, the view from the porch into the church, being now uninterrupted, is much improved. By the assiduous energy of Mr. Powell Breach, J.P., who may almost be described as the voluntary clerk of the works, the stone base of the very early font displaced some 40 years since in favour of a highly ornate composition base, has been brought back to the church, and at the suggestion of the vicar, the Rev. A. Congreve-Pridgeon, who has taken a warm interest in the work from the first, the restored font will be erected close by the south-west entrance, a hitherto wasted space in this corner of the church being admirably adapted for a baptistery. The Early Norman window on the north side of the church, not the least of its many interesting features, has had the stone reveals properly treated and now presents its original appearance, and much credit is due to Mr. Frank Duke, the builder, for the very careful way in which he has cleaned and brought into view much old stonework hitherto wholly or partly covered and defaced by modern plaster.

In the course of this work the respond and part of the stone reveal of the very early larger window in the north wall has come to light, and there is little doubt that were it permissible and possible to make a thorough search for missing original details, many would be found concealed behind the so-called improvements of the middle of the last century, when the church suffered much damage by ignorant restoration. One curious example of the manner in which the building was dealt with came to light in the reconstruction of the gallery of the tower, which is now reseated in a more convenient and comfortable way. Here, stowed away under the floor, was found the very handsome brass chandelier by which the church was formerly lighted. With its old wrought-iron hanging rods and well-designed brass arms, this large fitting is now safe from further desecration, although it is easy to see how eagerly it would have been sought for by any dealer in antiquities who knew that it was for these many years lost among the rubbish under the flooring.

The partial reseating of the chancel and the alteration of the pulpit will also be finished in time for the Harvest Thanksgiving, but the new low screen across the chancel and the two side screens for the aisles have yet to be carried out. By rearranging parts of the seating and filling up some odd spaces, the architect (Mr. C. E. Clayton, of Clayton & Black) expects to be able to give nearly as much accommodation as before the galleries were removed, and if his suggestion were accepted that the church should be reseated throughout with comfortable modern church chairs there would, if anything, be an increase in the accommodation. Altogether the improvements already made cannot fail to gratify those who remember how much this beautiful building was marred by the obstructing galleries and other modern additions.

#### LIGHTNING PROTECTION FOR CHIMNEYS.

STANDARDS for lightning protection for power-plant chimneys in the navy yards have been adopted by the United States Navy Department, the proposed means being varied for different heights of chimneys to cover those found in the different yards. It is specified that the conductors shall each be made up of seven No. 10 copper wires, two in number for chimneys up to 50 feet in height, three for chimneys between 50 feet and 100 feet, and four in number for those higher than 100 feet, in all cases being symmetrically disposed around the stack and forming a cage enclosure. They are to be fastened firmly without insulators to the outside chimney surfaces by bronze anchors, the latter being spaced 10 feet apart and soldered to the conductors at 50 feet intervals. At the bottom of the stack the conductors connect with 3 feet by 3 feet by  $\frac{1}{8}$ -inch copper earth plates buried in the ground below the water line, and at the top to a  $1\frac{1}{2}$  by  $1\frac{1}{2}$ -inch copper ring, to which the discharge tip rods are attached. The latter are of  $\frac{3}{4}$ -inch solid copper, 10 feet in length, spaced 4 feet apart around the circumference of the chimney cap, each terminating in a two-pointed aigrette. The portions of the conductors near the chimney base are to be protected by a  $1\frac{1}{2}$ -inch galvanised iron pipe sheathing, rising 10 feet above the ground level and extending 3 feet below it.

#### SHAM BRITISH CEMENT.

IN his report upon the trade and commerce of Belgium Consul-General Sir Cecil Hertslet again directs attention to the systematic habits of the dealers in Belgian cement in passing off their productions of inferior quality as an article of British manufacture or British origin at exceptionally low prices, which cannot be approached by makers in the United Kingdom so long as they retain the high standard for which British cement is famous. Sir Cecil Hertslet says that the blame cannot be put so much upon the Belgian manufacturers themselves as upon the commission agent and dealers of that class, who furnish any labels that may be required to the makers to attach to the barrels or cask when forwarded from the works, many of which labels are undoubtedly infringements of trade-marks of makers in the United Kingdom. It seems to be difficult for the British manufacturer to trace the fraudulent imitations which are being passed off under his particular brand in the colonies and foreign countries. It would seem, however, that buyers are beginning to realise that much of the cement manufactured in Belgium, described as "Portland" cement and having British names and brands, is not the genuine article, but is in every sense inferior to the British production, and in many cases is not entitled to be called Portland cement at all, according to the accepted standard. Of late there has been considerable reduction of Belgian exports of cement to the United Kingdom and British colonies.

THE gas committee of the Manchester Corporation have decided, subject to the approval of the City Council, to accept the tender of Messrs. Nuttall & Co. for the construction of a tank for the new gasholder which is to be added to the gasworks at Bradford Road. The sanction of the Council was given some months ago for these new works. The cost of the tank will be between 30,000*l.* and 40,000*l.* but that of the tank and holder combined will be not less than 100,000*l.* The capacity of the new holder will be 10,000,000 cubic feet. The largest holder at present in use in Manchester will hold 7,000,000 cubic feet. When the new one has been completed it will be the second largest in the United Kingdom.

Park Works, MANCHESTER.      Salford Ironworks, MANCHESTER.  
Queen Anne's Chambers, Westminster, LONDON.

**BUILDING IN GLASGOW.**

ACCORDING to the annual statement of Glasgow Dean of Guild, there were granted 461 linings during the year, or licenses to build, against 449 for the previous twelve months, being an increase of 12. The district in which the greatest activity had prevailed was Queen's Park, where 21 linings were granted, none of which, he was happy to say, were for single apartments. They comprised 19 houses of two apartments, 170 of three, 18 of four, 38 of five and 41 of six. The value amounted to 120,230*l*. Maryhill came next with 137 houses of three apartments, 17 of four, 26 of five and 23 of six, the value being 111,860*l*. The Eastern District followed. There the single apartments reached the highest figure, the number being 102. In addition, linings were granted for 212 houses of two apartments and 85 of three, the total value amounting to 31,600*l*. The Western District had been practically at a standstill, there having been only one lining added to the roll in its case. That was for 21 houses of two apartments and 20 of three, the value being 7,000*l*. The Central District occupied the same position, only one lining for dwelling-houses having been granted. These houses numbered nine, consisting of two apartments, and were valued at 1,270*l*. In the Northern District, on the other hand, there had been an entire absence of enterprise in house building. They had not had a single lining for that district during the twelve months. In the case of public buildings there had been an increase over the preceding year of 100,000*l*. There had been an increase in the number of linings granted for warehouses, stores and workshops, the number being 133, against 99; but there had been a great shrinkage in the value, the figures being 241,000*l*. for the previous year and 119,000*l*. for this, making a falling away of 122,000*l*. Churches, halls and schools had declined both in number and value, the former being 9, against 20, and the latter 10,130*l*., against 133,535*l*. New streets had been granted during the year amounting to 5,461 lineal yards. They had also had important work carried out under decree of the Court at the instance of the Procurator-Fiscal affecting streets, &c., which amounted in value to 3,824*l*. The result of the year's work was that although the number of cases dealt with had been in excess of those of last year, the total

value of the linings granted was the smallest of any year since 1890—less than last year by 542,282*l*., and just a little over one-third of the value of the linings granted in 1901. The figures for 1905-6 were 1,440,387*l*., and for 1906-7 898,105*l*., the difference being 542,282*l*. Of this sum 260,572*l*. was due to fewer dwelling-houses being built. The most satisfactory fact in connection with the review of the year's work was that the applications for houses of two rooms headed the list, and that the number of applications for houses of one apartment was the lowest since 1886.

**TRAFFIC REGULATION.**

ON the 3rd inst. the presidential address was delivered by Mr. W. Noble Twelvetrees at the meeting of the Civil and Mechanical Engineers Society. The subject selected was "London Street Traffic Regulation," and especially arrangements for avoiding the intersection of traffic by a gyratory system, which would make a circular route compulsory. The application was shown by plans of the crossings in the Metropolis where traffic is most often delayed. In the course of his address, Mr. Twelvetrees said the system was first proposed by Mr. Holroyd Smith ten years ago. His idea was that the central plateau should be intersected by two roadways each wide enough for a single line of traffic, the object being to enable fire-engines or public processions to go straight through in any direction. This suggestion is ingenious, but it is problematical whether the theoretical saving of time in the case of fire-engines would be secured in practice, and there would always be risk to foot passengers occupying the central refuge, especially to those incapable of realising quickly that the emergency roads were about to be invaded.

The proper use of the central areas is to provide halting places for foot passengers choosing to pass through vehicular traffic, and provide appropriate sites for drinking fountains and public monuments, while in suitable positions they could be planted with trees or partly converted into gardens. In many places, as already suggested, the central areas would afford admirable sites for underground railway stations, with circular galleries and radiating subways for foot passengers. In other places, again, the central portion

## No. 2 "SIGNET" Combined Range and Sitting-Room Grate.

Very suitable for Small Houses, Country Cottages, Flats, &c. (Patented).

Combines in itself in a practical and efficient manner the essential features of a Cooking Range and Sitting-room Grate.

ATTENTION is specially directed to the "Signet" Patent Combined Canopy and Damper with which all these Grates are fitted. It will be found to be of great use as a FUEL ECONOMISER by adjusting it so as just to permit of the smoke getting away, but no more, thus preventing the escape of warm air into the chimney, and giving the radiating power of the Grate its full value as a means of warming the apartment; also as a baffle against down draughts, &c. IT IS THE ONLY GRATE OF ITS KIND POSSESSING THIS IMPORTANT FEATURE.

Has been THOROUGHLY TESTED and has given UNIVERSAL SATISFACTION. This Grate can only be supplied through Builders' Merchants, Ironmongers, &c. Copies of unsolicited testimonials and further particulars may be had from the Makers,

LONDON OFFICE AND SHOWROOMS: 18 & 19 Queenhithe, Upper Thames Street, E.C.

of the circular refuge might be excavated and walled round, so that the opening would give light and air to a central hall connected by subways with the foot pavements around the street junction. At the same time, excellent accommodation could be made for lavatories, boot-cleaning and hair-dressing rooms, and other conveniences likely to be of general utility.

In the address the object has been not only to demonstrate the advantages of the gyratory system for ordinary vehicles and tramway traffic, but to point out various places where the system could be adopted in a tentative manner, so as to afford opportunities for observing its effect before undertaking projects of a similar character where considerable expenditure of public money would be unavoidable. As a direct practical suggestion Mr. Twelvetrees proposes to the City Corporation that the experiment should be made forthwith at Ludgate Circus, to the Commissioner of Police that it should be tried at Oxford Circus, and to the London County Council, acting in co-operation with the Commissioner of Police, that it should be adopted at St. George's Circus after reorganisation of the tramway lines in that area. These experiments would cost very little, and the results attained would probably pave the way for one of the most important series of improvements hitherto undertaken in the Metropolis.

### CAST-IRON AND MALLEABLE CAST-IRON.

THE first meeting of the autumn session in connection with the Staffordshire Iron and Steel Institute took place at the Institute, Dudley, on Saturday night, when the newly-elected president (Mr. Robert Buchanan) delivered an address. He remarked, says the *Birmingham Daily Post*, that a little reflection would show that in the world as a whole there were no definite periods of time which might be called the ages of stone, bronze, or iron, though for certain countries such definitions might be correctly applied. Proof existed that each age overlapped into the succeeding one. It was very remarkable that the production and utilisation of cast-iron came very late in the life history of metals. Iron and steel had been produced directly from

iron ores thousands of years before cast-irons came into notice as a metal of utility. It was very probable that cast iron had often been made before its utility was perceived. The inception and development of the blast furnace had a most important result. So far as the Western world was concerned it caused wrought-iron and steel to be produced by the indirect method of first making pig-iron. The direct methods of producing iron and steel still lingered in India, Africa and other parts of the world, where the poverty of the workers and the ignorance of mechanical appliances, and possibly their prejudices, caused them to adhere to the old time-honoured method. The iron and steel, however, produced by these crude methods were still unsurpassed in quality by the very best produced in the Western world with all the science and mechanical appliances they had at their command. The President proceeded to enumerate some of the leading events in the history of cast-iron production in England. Coming to 1619 he remarked that in that year Dud-Dudley, one of the great pioneers of iron manufacture and one of the most pathetic figures in English industrial life, by the influence of his father, obtained from King James a patent to make iron by a new method. He made pig-iron at Pensnett and refined it at Cradley Forges. By a combination of ironmasters interested in the making of charcoal-iron he got out of his works at Pensnett and Cradley, and began again to make pig-iron in furnaces at Himley. Not having a forge and the necessary refining furnaces for treating the pig-iron for the production of bar-iron, he was under the necessity of selling his pig-iron to the charcoal ironmasters, who by some means got the Himley furnace into their hands, with the result that Dudley built a new and larger furnace near Sedgley. This furnace was 27 feet square and built of stone, and produced seven tons per week, which Dud Dudley states was the greatest quantity of pit coal iron that had ever been made in that period in Great Britain. With a period of 250 years to bridge it was difficult to know the whole man, but enough was known of Dud Dudley to show that his was a most fascinating character. His declared intention was to build up again the iron trade of England by the use in iron-making of the small coal which was being thrown aside as waste material at the collieries. It was reserved for one of a later generation

living in happier times and under more favourable conditions, to succeed where he failed. A study of the life of Dud-Dudley, however, left us with the knowledge that early in the seventeenth century in South Staffordshire a great man was born. He lived and worked, triumphed and failed, fought and suffered, and exhibited through all an invention, perseverance, patriotism and fortitude which compelled admiration. Coke as a fuel for blast furnaces still held the field, and was likely to do so, but the reciprocating engine of James Watt was gradually being ousted from its place by the gas engine using blast furnace gas. Thus, as the production of pig-iron increased and its cost declined, so the foundries increased in number and capacity and their products reached all parts of the world. The proper working of cupolas was a subject which was receiving from foundrymen in general a considerable amount of attention, but there were still a considerable number of them who had the haziest ideas as to what was taking place as smelting proceeded. In regard to malleable cast-iron, this industry, which was an important one in South Staffordshire, would in his opinion truly advance when those practising it came out in the open and told of their failures. He was content that they should keep their success to themselves. Judging the heat of the annealing oven by the human eye was subject to too many causes of inaccuracy of vision to be reliable. He urged the importance of using scientific accessories for this work. It would readily be granted that a continuous supply of young skilled foundrymen, able to take the places of those passing out of the business by death or other causes, was of enormous importance. It was to the foundries engaged in engineering work or to "jobbing" foundries that they must look for the supply of skilled men. Technical schools and colleges had sent a great message for the foundry worker, and especially for the foundry foreman or manager, but for training in practical work they were inadequate. It should be realised by all proprietors of foundries and all having authority in them that the proper training of the apprentice was a measure of the highest economy and an important step in self-preservation. In this country it was invariably the case that foundries were designed by people who knew nothing of foundrywork, and

were so self-satisfied as to be able to do without the help of those who did know. The result in many cases was what might be mildly described as a miserable failure. Changes of method of work could only be wholly successful when they allowed the workman, as well as the capitalist, to better his position. Wide and sustained recognition of this fact was the only way to get the whole-hearted co-operation of workmen when changes of method of work became necessary. They were now at a transition period for many foundries. The plants which for a great number of years had been engaged in casting parts of reciprocating engines had had to tackle the problems and difficulties of the steam turbine. He had no expectation that the practical foundryman of to-day and of bygone days was likely to be surpassed in the future. What he hoped to see was a higher type of foremen and managers. In conclusion, he said he was sure that that Institute was fostering and increasing this desire for higher knowledge, and as far as lay in its power satisfying it.

### FRENCH BETON.

THE American Consul-General, R. P. Skinner, of Marseilles, gives the following account of the preparation of béton, which has long been a favourite material in France :—

Lime béton has been in longer and more general use than cement concretes. It was a first-class material when made with ordinary quicklime, and since hydraulic lime has been used it is better. It is a cheaper composition than cement béton or concrete, easier to work, and if the initial load be not too great it is for nearly every purpose just as good. A good lime béton can be obtained by mixing mortar and stones, gravel or cinders, mortar and good-sized stones making the best composition. Probably one-half of the houses in Marseilles have been built of this material, and thousands of the older buildings many hundred years old are held together by ordinary lime. Walls built of quicklime béton must be laid up slowly, but with hydraulic-lime béton they can be erected as fast as masons can work. The solidity of lime-béton construction is shown by the sea

walls and docks in Marseilles, where masonry of this kind may be seen both above and below sea water, the most difficult test to which building material can be subjected.

The lime is weighed out to the cubic unit of sand and the two dry mixed. Water is added slowly with a sprinkler and the plastic consistency tested by forming a ball with the hand, which should exude a slight moisture, and being laid aside should neither flatten nor crack open. A mortar of 500 kilos (1,102 lbs.) of lime to 1 cubic metre (1,308 cubic yards) of sand, mixed and beaten dry, has more resistance than an equal quantity of pure lime. A house-building mortar contains from 440 to 551 lbs. of lime per cubic metre (1,308 cubic yards) of sand. This is sufficient also for small arches and viaducts. For tunnels, foundations and viaducts of considerable height the proportion of lime is increased by 110 lbs., while for important arches and dams subjected to pressure the amount of lime per unit of sand is from 661 to 771 lbs.

Stones or other cheap material are mixed with the mortar, thus constituting the béton. Cinders, coke and furnace slag may be substituted for stones in ordinary house and wallwork. If broken stone is used, the pieces are from 0.78 to 2.36 inches in length. The proportions are usually two parts of stone for one of mortar for work under water; in open-air work the proportion of stone may be increased. For open-air work a coker or mould is built, into which the béton is poured in horizontal layers from 8 to 12 inches thick and then rammed. A layer of béton cannot be distributed above another which has already set until its surface has been picked and washed and finally given a coat of cement and water of the consistency of cream.

In both France and Germany a light-weight béton is made of cinders. Buildings several storeys in height can be erected of this cinder béton, which can be laid as in the other cases cited or treated like armed cement. One-storey structures require no anchorage bars. Several very large factories have been built at Lyons of this béton. Sometimes the cinders are worked into blocks and laid up like cut stone. In all cases the cinders must be screened and then mixed at the rate of one cubic yard of cinders to one-half cubic yard of hydraulic mortar, composed of 440 lbs. of hydraulic lime to 35 cubic feet of sand, or the lime can be

replaced by 330 lbs. of Portland cement. The proportion of mortar can be shaded slightly if the materials are good.

The striking economies effected in France are obtained by the free use of cheap local material, whatever it may be, and by the equally free use of lime where cement probably would be used in the United States. If the work be carefully planned and performed, hardly more lime is needed than if cement were used; and whereas a good Portland cement now costs from 10.22 dols. to 10.60 dols. per ton in Marseilles, an equally good hydraulic lime costs but 6.35 dols. per ton. In the rural districts the peasants use any kind of lime, and they build houses which last hundreds of years. Buildings constructed with béton can be completed by a coating of lime or cement mortar, which, being laid on and lined, gives a finish that loses little by comparison with cut stone and effectually prevents the absorption of moisture.

A CORPORATION brick-making plant has been formally installed at Nelson, Lancs, by which a waste product at the refuse destructor works will be utilised. The plant has a producing capacity of 15,000 bricks weekly. The bricks are made out of the clinker produced by the furnaces at the refuse destructor. About 8 per cent. of lime is added to the clinker after it has been placed in a grinding machine. It is ground to a powder and thoroughly sieved. It is then conveyed into a steam mixer, and the lime having been slaked the compound is allowed to stand in a silo for a time. This mixture is much the same in consistency as blue loam. The next process is the pressing and moulding, for which there is a special machine, and the bricks are finally baked for eight hours in a large chamber, which is heated to 120 deg. Fahr. The price of the bricks thus made is said to be 18 per cent. less than that of common bricks. The cost of the new undertaking is about 3,000*l.*, and in connection with it there is a solder recovery plant and a tin baling press. The solder extractor is a furnace in which the disused tins which come to the refuse destructor are placed. Solder is extracted to the extent of 50 lbs. per ton of metal used, and there is ready market for it at 8*d.* per lb. After the solder has been extracted the tins are placed in a large press and pressed into bales, which are disposed of at the rate of 12*s.* 6*d.* per ton.

**EDITORIAL NOTICES.**

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

**TENDERS, ETC.**

\* \* As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

**COMPETITIONS OPEN.**

ALTRINCHAM.—Oct. 21.—Proposed secondary school for Cheshire County Council. Architects desiring to compete should send their names by above date to Mr. J. Howarth, clerk, Education Offices, Market Street, Altrincham.

BOOTLE (LANCS).—Jan. 31.—The Bootle education committee invite designs for a public elementary school for 1,000 children. Conditions and particulars may be obtained from Mr. J. Henry Farmer, town clerk, Town Hall, Bootle.

CEMAES.—Oct. 15.—The Twrc-lyn Rural District Council invite plans and specifications for a drainage scheme for the village of Cemaes, Anglesey. Competitors are requested to state the remuneration required by them for the plans, specifications and supervision of the work. Mr. Thomas Hughes, clerk, Brynaethwy, Menai Bridge.

DOVER.—Oct. 14.—The committee of the Dover pageant, July 27 to August 1, 1908, invite coloured designs for a suitable double-royal poster (40 inches by 25 inches). There should be some indication of the sea, a ship and Dover as the key of England. Prizes of 10l., 2l. 10s. and 1l. are offered. The prize-winning designs will become the absolute property of the committee. The Secretary, Pageant House, Dover.

LONDON.—Oct. 14.—The Acton District Council invite architects who have been in practice for at least seven years to send in to Mr. Wm. Hodson, clerk, 242 High Street, Acton, W., before Oct. 14, designs for erection of the proposed Council offices, at a cost not exceeding 18,000l. An assessor will be appointed, and premiums of 100 guineas, 50 guineas and 25 guineas will be awarded for the designs selected by the Council after their consideration of the assessor's award. Particulars can be obtained upon the payment of 10s. 6d.

WARRINGTON.—Nov. 30.—The Directors of Warrington Garden Suburbs, Ltd., invite architects practising within a 30-mile radius of Warrington and architects having previous experience in the planning of garden suburbs to submit competitive designs for laying-out their estates at Great Sankey and Morrisbrook Farm, Grappenhall. Conditions and particulars may be obtained on deposit of 1l. 1s. Mr. A. Bennett, Secretary to the Company, Market Gate Chambers, Warrington.

## CONTRACTS OPEN.

AMBLE.—Oct. 15.—For building farmhouse at Amble Link farm. Mr. R. G. McInnes, agent, Amble, Northumberland.

BACUP.—Oct. 19.—For reconstruction, widening and improvement of the bridge carrying Blackwood Road over the river Irwell at Stacksteads. Deposit 1*l*. 1*s*. Mr. W. H. Elce, A.M.I.C.E., borough engineer, Municipal Buildings, Bacup.

BASINGSTOKE.—Oct. 21.—For installation of low-pressure hot-water apparatus at new Council schools. Deposit 2*l*. 2*s*. Mr. W. J. Taylor, county surveyor, The Castle, Winchester.

BELPER.—Oct. 22.—For erection of a galvanised corrugated iron building about 1½ miles from Belper goods station. The building to be 90 feet by 36 feet, capable of holding 600 people; at the rear, scullery (24 feet by 12 feet) and kitchen (13 feet by 18 feet). Mr. R. B. Muir, secretary, Belper River Gardens, Belper, near Derby.

BEVERLEY.—Oct. 15.—For erection of a high school for girls in Norwood. Deposit 1*l*. 1*s*. Mr. B. S. Jacobs, architect, Lincoln's Inn Buildings, Bowldalley Lane, Hull.

BRADFORD.—For erection of mill and warehouse in Longside Lane. Messrs. James Young & Co., architects, 62 Market Street, Bradford.

BRAUNTON.—Oct. 17.—For roofing buildings, &c., at Bearcharter Farm, Braunton, Devon. Messrs. Sanders & Son, auctioneers, Barnstaple.

BRIDPORT.—Oct. 21.—For erection of a secondary school in St. Andrew's Road. Mr. F. Cooper, architect, 77 East Street, Bridport.

BURY.—Oct. 21.—For alterations and additions to baths superintendent's house, St. Mary's Place. The Borough Engineer's Office, Bank Street, Bury, Lancs.

BURY.—Oct. 15.—For building vaults (single and double) required during next twelve months. The Borough Engineer's Office, Bank Street, Bury, Lancs.

CANTERBURY.—Oct. 16.—For alterations and extensions to city police station in Pound Lane. Mr. Arthur C. Turley, A.M.I.C.E., city surveyor, Guildhall Street, Canterbury.

CLEADON.—Oct. 15.—For erection of new Council school at Cleadon, Durham. Mr. J. H. Morton, architect, 50 King Street, South Shields.

DARLINGTON.—Oct. 19.—Separate tenders for each trade are invited for erection and completion of ten houses in Fulford Place, Harrowgate Hill. Apply 128 Thompson Street West, Darlington.

DUBLIN.—Oct. 14.—For construction and erection of a steel umbrella platform roof, 132 feet by 21 feet 6 inches, at their Clones station, also for supplying and delivering at Drogheda station twenty steel cross girders, weighing rather less than one ton each, for the Great Northern Railway Company (Ireland). Mr. W. H. Mills, engineer-in-chief, Amiens Street, Dublin.

DUBLIN.—Oct. 22.—For the superstructure of the college in Upper Merrion Street, and for erection of workshops adjoining. Deposit 5*l*. 5*s*. The Secretary, Office of Public Works, Upper Merrion Street, Dublin.

GLASGOW.—Oct. 14.—For (1) digger, brick and mason; (2) wright, glazier and ironmongery; (3) plumber; and (4) roof tiling and rough castwork of bowl house to be erected in Ruchill Park. The Office of Public Works, 64 Cochrane Street.

GRANGE-OVER-SANDS.—For erection of stables, harness-room, carriage-house, &c. Messrs. J. W. Grundy & Son, architects and surveyors, Ulverston.

HALIFAX.—Oct. 12.—For alterations at Phoebe Lane Mills. Messrs Samuel Robinson & Sons, architects, Cheap-side, Bradford.

HALIFAX.—Oct. 18.—For mason and bricklayer, carpenter and joiner, plumber, slater and plasterer, concreter, iron-founder, rolled steel, patent glazier and painter's work required in extensions to shed, &c., at Ladyship Mills. Messrs. Joseph F. Walsh & Graham Nicholas, architects and surveyors, Museum Chambers, Halifax.

HULL.—Oct. 17.—For erection of science buildings at Hymers College. Deposit 1*l*. Mr. John Bilson, architect, 23 Parliament Street, Hull.

IRELAND.—Oct. 14.—For building a dispensary residence and dispensary at Anamoe, for the guardians of Rathdrum Union. Mr. George T. Moore, C.E., 1 and 2 Foster Place, College Green, Dublin.

WOODBIDGE.—Oct. 12.—For erection of a Council school and special subjects centre at Woodbridge, East Suffolk. Deposit 2*l*. Mr. Jno. S. Corder, architect, Tower Street, Ipswich.

It is reported that the Lambeth borough treasurer has discovered that a local contractor neglected to pay the current rate of wages, and the Borough Council has accordingly decided to retain 27*o*l., this being the difference between the amounts the men should have been paid and the sums actually received by them. On previous occasions the Council have taken similar drastic measures with other contractors who have not paid their men the rate of wages scheduled in the conditions of contract, and it is computed that considerably over 1,000*l*. has been extracted in this manner by means of penalties.

For the convenience of passengers about to travel to the Riviera, the South-Eastern and Chatham Railway have arranged with the French railway companies for a first-class carriage, with Lits salon accommodation, to run daily from Calais to Marseilles, Cannes, Nice, Monte Carlo, Mentone and Ventimiglia, in connection with the Dover boat train leaving Victoria and Holborn at 11 A.M. Intending visitors to Vienna and Trieste are informed that a through sleeping-car will run daily from Calais without change of carriage.

## LONDON—continued.

For construction of the portion (section 3) of the new northern low-level sewer between Stepney and Trafalgar Square. (As the result of representations made by the Dean and Chapter of St. Paul's Cathedral, the proposed route of the sewer in the vicinity of the cathedral was altered in order to obviate all question of damage to that building. It is estimated that the cost of construction has been increased by 2,000*l.* as a result of this alteration.)

## TRADE NOTES.

THE heating of the extensive locomotive building works of the Vulcan Foundry, Ltd., Newton-le-Willows, the cubical contents of which amounts to nearly 5,000,000 cubic feet, has been entrusted to Messrs. E. Oldroyd & Co., Ltd., Crown Works, Leeds.

THE clock in the celebrated twisted steeple of Chesterfield is now undergoing a thorough renovation and alteration. The dials have been repaired and repainted, and the alterations to the clock are being carried out by John Smith & Sons, Midland Clock Works, Derby.

THE Electric and Ordnance Accessories Company, Ltd., of Stellite Works, Cheston Road, Aston, Birmingham, have just been awarded a gold medal by the New Zealand International Exhibition. In their exhibit a special feature was made of the Stellite telephones and telephone accessories, in addition to their general electrical manufactures. The exhibit was in the hands of their sole agents for New Zealand, Messrs. C. A. Hamlin & Co., of Auckland.

MESSRS. GEORGE MILLS & Co., engineers, Radcliffe, near Manchester (proprietors of the "Titan" sprinkler), have received the following letter from Messrs. The Radcliffe Spinning Co., Ltd., New Road Mill, Radcliffe:—"We beg to inform you that a fire broke out in one of our mule rooms on September 13, and almost instantly the whole room seemed to be one flame of fire, our workpeople having to get down the staircases and fire escapes as best they could. The sprinklers you erected some few years ago came into operation at once and rendered most valuable service, and it is a pleasure to us to give this testimony to their very prompt action, and to say further that had it not been for the sprinkler the whole of the mill would have been burned down."

ORLEANS HOUSE, Twickenham, which possesses some historic interest, was offered for sale on Monday, but as the highest bid was 18,500l. the property was temporarily withdrawn.

MR. W. BOYD, the first mayor of Wallsend, has given instructions through his architects, Messrs. Liddell & Brown, to Messrs. Wm. Potts & Sons to erect an illuminated clock at Wallsend town hall. Messrs. Potts are also making a

clock for the Bradford Grammar school and for buildings.

PRELIMINARY to their futile attempt to reascend the airship at the Crystal Palace on Tuesday last, Mr. Capper and Mr. Cody went up the North Tower by means of Waygood's lift, accompanied by our representative in order to take an observation of the meteorological conditions and were much gratified with the fine view obtainable from that elevated position, extending over the counties of Surrey and Kent.

At a meeting of the Infirmary site committee of the Manchester Corporation on Monday it was stated that T. E. Collcutt had accepted the committee's invitation to visit Manchester and give his opinion on the question whether it is possible to adapt the old Infirmary building for use as an art gallery and a public reference library. Mr. Collcutt proposes to make his inspection of the buildings on Tuesday and Wednesday next.

THE foundation-stone of St. Alban's Church, Bournemouth, was laid on October 8 by the Lord Bishop of Southampton. The cost of the work to be carried out at present will be 7,435l. We shall publish in next week's issue the design from the architect's drawing, by which it will be seen that Bournemouth is to have another example of church architecture. Mr. G. H. Fell Prynne, F.R.I.B.A., 6 Queen Anne's Gate, Westminster, S.W., is the architect, and the builders Messrs. Bowmans, of Stamford.

A NEW parish hall at Long Ditton, Surrey, was opened last Saturday by the Bishop of Kingston. The hall, which has accommodation for 400 people, is 72 feet 6 inches long by 36 feet wide, including a platform 15 feet 6 inches long. At the side of the hall away from the road an ante-room 14 feet 6 inches long by 12 feet wide is provided, lavatory, &c. The heating, by means of hot-water radiators, has been carried out by the London Warming and Ventilating Company, and the electric lighting by the Surrey Electricity Supply Company. The walls are of red brick to match the adjoining parish room and workmen's club, the roof is covered with Broseley tiles. The architect was Mr. A. J. Style, F.R.I.B.A., of 3 Victoria Street, Westminster, and of Thames Ditton, and the contractor Frank Hawkey, of Surbiton.

## VARIETIES.

Hull electric-light committee have decided to apply loan of 31,200*l.* to meet the requirements of the committee for the next three years.

HE Alloa School Board have unanimously adopted a plan, prepared by Messrs. Kerr & McCulloch, Alloa, for a school to accommodate 800 pupils at an inclusive cost of 100,000*l.*

HE housing committee of the Swansea Corporation estimate that twenty-six houses in Colbourne Terrace have been let at 6*s.* 6*d.* per week. The contract price was 205*l.* per house and the actual cost 209*l.*

HE Newport Parliamentary committee recommend that provision be made to the Local Government Board for a loan to borrow a further sum of 10,000*l.* required for the purposes of the Transporter bridge.

HE Leeds Distress Committee have decided to apply to the Local Government Board for a grant of 1,000*l.* to be used in wages to men employed on afforestation work in Vashburn Valley.

HE Thrapston Council school managers have adopted a plan prepared by Mr. J. T. Blackwell, architect, Kettering, for a new school. The plans provide for 150 children—infant department 125, infant department 25. The estimated total cost, including site, building, furniture and architect's fees, was stated to be 3,000*l.*

INTERESTING experiments in tree-felling by electricity have been made during the past day or two on the Antrim Estate, Belfast. The rope was tied round the tree, and the end was then attached to an electric tram, which was in motion, and with astonishing ease the tree was cut down to the ground.

HE Royton District Council have decided to erect public baths on the land owned by the Council in Park Street, at a cost of between 4,000*l.* and 5,000*l.* The baths will comprise a plunge bath of the regulation size and twelve slipper baths. They will be the first public baths erected in the district.

THE diamond jubilee of the opening of the Roman Catholic cathedral of St. George, Southwark, will be celebrated by the completion of the tower and spire of the edifice designed by Pugin's designs, somewhat modified. The cathedral is

built on the site of the old St. George's Fields, where in 1780 Lord George Gordon assembled his followers.

A SITE has been taken at the Garden City, Letchworth, Hertfordshire, for the erection of cottages with a central cooking-hall for cooks and domestics, all tenants to share in the expense, the object being to save wives the "worry and expense of preparing meals," and to give servants "greater freedom and new dignity to their calling."

THE Mayor of Blackburn was recently invited by the Post Office authorities to open the new building in state, and it was intimated that the Postmaster-General would attend the function. His Worship, however, intimated that, in view of the inadequate and unsatisfactory building the Department had erected, he must decline to be associated with its opening.

THE Local Government Board has notified its intention to hold a public inquiry respecting the excess expenditure of 18,350*l.* on the Tottenham municipal buildings, for which the District Council proposes to raise a loan. The Ratepayers' Association has engaged professional assistance in the examination of the many documents relating to the erection of the buildings.

PLANS have been prepared for the erection of about 100 miners' houses in the neighbourhood of Summerlee Street, Cuthill, for the Prestongrange Coal Company. These are to be commenced immediately. The fields are cleared of their corn crops. During the last two years hundreds of miners' houses have been put up in the neighbourhood of Prestonpans.

AXMOUTH BRIDGE, near the mouth of the Axe (Devonshire) has been thrown open for the use of the public. For thirty and a half years a toll has been levied on all using the bridge. A gift of 2,200*l.* towards the purchase of the bridge and toll-house by Mr. and Mrs. Stephens, of Stedcombe Manor, Axmouth, made the removal of the toll possible.

A REPORT has been presented to Leith Town Council regarding the proposed extension of the electric tramway system to the suburban districts. A conference is to be invited with the Edinburgh Corporation with the view of having certain portions of the work undertaken jointly by Edinburgh and Leith. The cost of the scheme is estimated at 76,000*l.*

THE Roads Improvement Association are completing the arrangements for the deputation that will wait on the Government early next session to press for the formation of a Central Roads Board and the grant of 1,000,000*l.* for road improvements throughout the country. The Association maintain that the advantages to be obtained by the control of the roads by a central authority would be a reduction in cost, better roads, a fair apportionment of cost and less dust.

THE Scarborough Royal Albert Drive committee report that the Local Government Board has given their sanction for the borrowing of 21,556*l.* for the carrying out of the work of the drive. It was also reported that Sir William Matthews, the engineer who was called in by the Corporation, will visit Scarborough at an early date and inspect the work done by the contractor at the sack-dam section to see whether it is in accordance with the award.

MESSRS. CAMMELL, LAIRD & Co. it is reported, intend shortly to lay down extensive electrical plant at their Clyn Colliery, near Swansea. The firm will manufacture their own motors, dynamos, &c., and, besides providing power and light, will gradually introduce an electrical system of haulage. Plans are also being considered to develop the adjacent large area of coal, the lease of which the company have recently taken over.

At a service in St. Stephen's parish church, Norwich, three new bells were dedicated and the south-east chapel reopened after having been entirely reroofed; the decayed oak timbers of the old roof were found to be in such a condition as to necessitate their removal. The reconstruction work was carried out under the superintendence of Mr. Arthur J. Chambers, architect, the builder being Mr. J. S. Smith of Norwich. The casting and hanging of the bells was entrusted to Messrs. Geo. Day & Son of Eye.

A SPECIAL meeting of the Belfast Corporation was held recently for the purpose of considering the question of a new abattoir. Plans were submitted for an establishment sufficient to meet the requirements of the next fifty years, which it was estimated would cost 33,000*l.* or 34,000*l.* After over two hours' discussion the market committee were authorised to submit alternative plans of modern accommodation at the Stewart Street site, the total cost not to exceed 30,000*l.*

THE Stirling Water Commissioners have unanimously agreed to the construction of a new 15-inch water between the reservoirs and the town at an estimated cost of 10,500*l.* It was reported that the powers for the execution of the work would expire in August 1908. An additional will obviate all causes of complaint, it is thought, until when loans of 26,250*l.* will expire, and when the commissioners will be in a position financially to consider the question of an additional reservoir.

THE death is announced of Mr. James Watherston, the firm of John Watherston & Sons, builders, Edinburgh, at the age of seventy-six. Mr. Watherston was identified with the building trade in the city for over a quarter of a century, and his firm erected many of the big warehouses. In the early seventies he was a member of the Edinburgh Dean of Guild Court, and he often gave evidence in valuation cases, considerable weight attaching to his opinions by reason of his extensive experience.

For nearly a year past the Bermondsey Borough Council have been carrying out a system of filtration and aeration with the object of saving the heavy expense of water for public swimming-baths. A bath has been used by 300 persons during the last ten months, and the medical officers report that the filter has been doing its work effectively. In future, however, the Council does not propose to continue the use of the water for so long as ten months, but to renew it twice during the summer and once during the winter.

THE main generating plant on the *Mauretania* consists of four turbo-generating sets supplying continuous current at 115 volts. Each set has a normal capacity of 375 kilowatts, or a total of about 2,300 horse-power. This power is used not only for lighting, but also for driving fans for producing the forced draught at the boilers (about 900 horse-power alone being required for this purpose), for ventilation, for driving lifting tackle and working the passenger and freight elevators, for driving refrigerating machinery and many other services.

THE contract for the erection of the chancel and bays of the nave of the new church of St. Agnes, Reddish, has been let to Messrs. George Macfarlane & Manchester. September next is the time specified for completion of this portion of the work. The price is

ool, and seating accommodation is to be provided for 50 people. The second part of the building is to be provided with when sufficient money has been raised to enable the scheme to be completed by the erection of two more bays.

Two curious claims for damages have been brought against the West Riding of Yorkshire authority. One claimant asks the County Council to pay the cost of repainting a motor-car alleged to have been damaged by works of spraying on the Ripon and Harrogate main road. The committee repudiate the claim. The other claimant asks compensation for damage to a horse alleged to be due to spraying on the Skipton and Otley main road. The committee also declined to recognise liability in this case.

THREE blocks of working-class dwellings erected at Sheriff Brae by the Leith Town Council having already shown a deficiency of 494*l.* on the working, the treasurer's committee have been asked to inquire into the matter. It has been suggested that the Council might dispose of the property, even at a loss, rather than be forced to take this paper after the property depreciated in value. The blocks—three in number—which were erected as an experiment, cost 14,000*l.*, including 3,000*l.* for the site. They were intended to accommodate people living in the slums, but it is said that this class of tenant has not taken advantage of the provision made.

At a meeting of the Hungerford Rural District Council was decided that the plans, scheme and estimate for the drainage and sewage disposal works for the town, as prepared by Mr. H. H. Humphreys, be adopted, and that application be made to the L.G.B. for permission to raise a loan of 12,059*l.* 19*s.*, repayable during a period of thirty years. The question of drainage of Hungerford has occupied the attention of the Council for some years. The Council has been twice summoned for pollution of the river and other streams, and only recently were served with another summons. When the case was last before the magistrates the Council were fined 50*l.*

THE following is a copy of a letter received by Mr. J. Macdonald, M.P., secretary to the Labour Party, from the secretary to the United Operative Bricklayers' Society, Trades Hall, Sydney:—"The Sydney Labour Council have requested me to communicate with you re

state of trade in Sydney, so that intending emigrants may not be misled by fictitious advertisements and reports appearing in the English papers. I can assure you that it does not warrant any influx of bricklayers, as those that are here are not fully employed, and there are a few arriving from South Africa and sister States every week."

THE new waterworks at Walshaw Dean, belonging to the Halifax Corporation, have been formally opened. The construction of the works has taken seven years, and the total cost is about 300,000*l.*, a much higher sum than was originally estimated. A large part of the increased expenditure is stated to be due to the trenches having to be dug to a much greater depth than was anticipated to make the embankments of the reservoirs watertight. Extra cost has also been incurred in removing the peat, or in "beaching," as the work is termed. The three reservoirs will have a total capacity of 640,000,000 gallons, and will yield Halifax a daily supply of 2,500,000 gallons.

THE first public sitting of the departmental committee appointed by the Vice-President of the Department of Agriculture and Technical Instruction, for the purpose of inquiring into matters relating to afforestation in Ireland, was held at 4 Upper Merrion Street, Dublin, on the 3rd inst. The terms of reference of the committee are to inquire into and report upon the following matters relating to the improvement of forestry in Ireland, viz. (1) the present provision for State-aid to forestry in Ireland; (2) the means whereby in connection with the operation of the Land Purchase Acts existing woods may be preserved and lands suitable for forestry acquired for public purposes; and (3) the financial and other provisions necessary for a comprehensive scheme of afforestation in Ireland.

A SPECIAL committee appointed by the Accrington Town Council to consider the question of the lack of sufficient dwelling-houses in the borough reports that builders who have been in the habit of erecting new houses in the past have of late found it more difficult to sell newly-erected cottages than formerly. The prices of building materials and labour have advanced by quite 15 per cent., and owing to the small return on the outlay there is very little purchasing of house property for investment. "People," the builders argue, "can get a better return for their money in other directions." The committee, however, unanimously

decline to recommend the adoption by the Council of a municipal housing scheme. It was ascertained that up to six months ago there were empty houses in the town, and it is not expected that the very brisk trade which accounts for the present demand can be permanent.

At the last monthly meeting of the Street Noise Abatement committee it was stated that the following protest from the City of London Club had been forwarded to the City authorities and to the police:—"The committee of the City of London Club, Old Broad Street, consisting of 800 members, hereby protest against the noise and smell caused by motor omnibuses in passing through Old Broad Street, and earnestly request that the Chief Commissioner of Police and the proper authorities will take measures to diminish this nuisance." At the same meeting it was mentioned that it was proposed to ask the members of Parliament for the City to introduce a short Bill respecting "street noises" at the earliest opportunity, as every week was adding to the depreciation of property in all thoroughfares where undue noise prevailed.

LAST week the new Swansea Corporation waterworks at Cray, in Breconshire, the construction of which has cost over half a million, were opened. The area of the gathering ground is 2,680 acres, and by means of a dam 1,250 feet in length one thousand million gallons of water is collected for the use of Swansea and those localities on the way who agree to take the water. The depth of water at the dam is 100 feet. Connecting the reservoir with the twenty-four miles of pipes leading to Swansea is a tunnel under the Bwlch Mountain 4,777 yards in length. The tunnel is 5 feet high and 3 feet 6 inches wide, and the number of bricks used in the construction is three millions and a half. Cray is situated at an altitude of 1,000 feet above the sea. The whole of the works have been designed by Mr. R. Wyrill, Swansea Waterworks engineer, the consulting engineers being Messrs. G. H. Hill & Son, Westminster, S.W.

AMONG wills recently proved is that of Mr. George Coffin, of Eastfield, Festing Road, Southsea, Hants, builder (net personalty nil), amounting to 214,367*l*.

## THE ENGINEERING EXHIBITION.

CONTINUING our brief review of some of the exhibits at the Engineering Exhibition at Olympia we observe that Mr. James D. Prior, of the "Empire" Works, Hollis Street, Birmingham, gave at intervals explanations of heating specialties, the Venetian fire-grate with patent Venetian regulating bars and draught-controlling door. This burns either fast or slow, and the fire will burn all night without attention. By the Venetian system, too, an ordinary sitting-room grate gives a bountiful supply of water for baths, lavatories, &c., also warming other rooms by radiators and hot-water pipes. It is automatically changeable from an open or slow fire into a closed burning fire as required, and will burn all night without attention. A notable feature is also the skirting radiator fixed to skirting boards of bedrooms, each of which has a powerful heater, projecting only  $\frac{3}{4}$  inch into the room. The tubes are copper or brass, and may be heated by a kitchen range without discolouring the bath water. Many other appliances are on view.

Messrs. Lee, Howl & Co., Ltd., 110 Cannon Street, London, and Tipton Engineering Works, Tipton, Staffs, have heated furnaces and pumps of considerable effective power, and economy in work.

Messrs. Richard Hornsby & Sons, Ltd., of Grantham, London, have here a gas-engine and suction plant. The engine is coupled direct to a Lancashire dynamo by flexible coupling, and is driven by gas from a generating plant of their own manufacture. The unique feature of the engine is its simplicity, especially in the design of the valves which are all in sight and can be easily got at from outside and without taking anything to pieces. The engine draws in the gas as it is required from the generator, and when the engine is not running there is no gas being made, and none is ever under pressure. The engineering arrangement excited a great deal of interest and comment.

The "Stanlock" system of heating and ventilating factories and buildings by means of separate units is shown by the Standard Engineering Company, Ltd., Leicester. This system has been adopted by some of the leading engineering firms in this country, who have recently built

ks in the provinces. No overhead air pipes and no underground ducts are employed in this system. Both heating and ventilation are perfectly evenly distributed, any section of a building may be completely controlled independently of any other section of the same building. The apparatus involved is inexpensive, simple and efficient. Successful waterproofing for bridges, tunnels, foundations, &c., is shown by the *Gibson Waterproofing Company*, of 10 and 21 Tower Street, Upper St. Martin's Lane, London. The system consists in the use of a thin material, absolutely impervious to water, flexible, tough, elastic, proof against deterioration through age and specially fitted to withstand the injurious action of water and all underground conditions. As many sheets, or layers, of this impervious membrane as may be required are cemented together, and the stratum of waterproofing is so arranged as to be independent of the surface waterproofed, which may vibrate, rattle, twist or crack, expand or contract, without injury to the membrane protecting it; exactly as the hide of a hand or the skin of one's hand is free and independent of the surrounding tissue, so that it may readily and fully yield to every movement. The principle of flexibility, coupled with independence of movement, distinguishes the system from the old-school practice of using a more or less rigid material and sticking it fast to the surface to be waterproofed. It is a well-thought-out and effective system.

At a meeting at Clonmel last week of the South Kerry County Council the question of the surveyor's remuneration for an increase of salary was again under consideration, the Local Government Board having asked them to take it up. It was resolved "that the Council approve of the finance committee's recommendation not to increase the already increased salary of the county surveyor, as this question was fully considered. The increase of salary was refused, and subsequently when the county surveyor asked for a second increase, and that the Council considered the veiled threat of the Local Government Board to make an inquiry in the matter as an indication of its bias, pressed its determination to resist any unwarrantable interference with their right to manage their own affairs."

## NATURAL AIR GAS.

A REMARKABLE and ingenious adaptation of modern principles to lighting has been inaugurated at the Engineering Exhibition. Although several kinds of machines have been from time to time exploited, by this system for the first time air has been automatically and uniformly carburetted with a non-condensable proportion of hydrocarbon vapour. This with a machine that will adjust the supply under varying demands, fluctuations of temperature and during indefinite periods of time. The gas produced is non-explosive and has both heat, with an incandescent mantle of special pattern, and light.

When used with an incandescent mantle, however, the effect far surpasses the ordinary incandescent gas or electric light. This light is of a most beautiful colour, pure and "sunny," free from objectionable green and ultra violet rays. Another point is that the air in the room is not deprived of its oxygen, as is the case with coal gas, acetylene and other methods of lighting and heating. All the air required for complete combustion is supplied through the pipes by the apparatus. It has no objectionable fumes like coal or any other gas, as the products of combustion contain no sulphur, ammonia, phosphoretted or sulphuretted hydrogen, so common with and inseparable from coal gas and acetylene. The machinery for producing the air gas, which we understand is made under Glassgoe's patents, is novel and ingenious, and we are not surprised that the directors of the undertaking are loud in their praises and confident in recommending their system for public and private use.

## NEW CATALOGUES.

An interesting and useful catalogue dealing with reinforced concrete and steel construction has been issued by Messrs. D. G. Somerville & Co., which contains a great deal of information of value to those engaged in designing and constructing buildings by these methods. Messrs. D. G. Somerville & Co. have carried out a large number of contracts in ferro-concrete, and by the experience thus gained have learned that no one system is the most suitable for every

CITY OFFICE: 28 FENCHURCH STREET, LONDON, E.C.

purpose, but being licensed contractors for no less than six proved systems of reinforcing concrete are able to apply what is the best to each case.

Fireproof construction, although now generally adopted throughout a building, is in many cases confined to floors and roofs. Of these they have numerous types. Their hollow reinforced concrete tile construction forms a light yet strong floor, the main feature of this system being the hollow concrete tiles or tubes. The tiles are specially manufactured at their Southall works, and are composed of clinker concrete reinforced with steel rods, the tiles being laid between rolled steel joists or reinforced concrete beams, spaced at equal intervals and grouted in between the webs of the beams with concrete. Owing to the large air space obtained constant ventilation is given, and the air spaces deaden any sound from passing through. A contract on this system has just been completed at Messrs. Sandersons' new premises in Berners Street, W.C. This building was constructed on the American principle, a steel frame first being erected. The height of the steel stanchions was 100 feet from the foundations, these being formed in reinforced concrete. The lower floors are used as stores and business premises, the upper being planned as residential flats. In order to isolate the business and residential portions the hollow system of reinforced concrete floors was employed, with entirely satisfactory results. A feature of the show-rooms on ground floor is the central reinforced concrete dome, 33 feet square, with glass top. The sides of the dome in all cases cantilever from the main walls of the building, thus obviating the necessity for any supporting columns.

Another building constructed by Messrs. Somerville is the new premises at Paddington for the National Telephone Company. Here again the steel-frame construction was employed, the hollow reinforced concrete tile system being used throughout the floors and roofs. As floor space was a great consideration no centre columns were used, although the width of the building was 35 feet, heavy girders of this span being employed, supported by steel stanchions built into the outside walls. The roof of this building was of rather unusual design, being an elliptical arch springing from the side walls, the rise in the centre being 17 feet and clear span 35 feet, no tie rods being used.

Each principal weighed 3 tons, being built up on site in three sections. All steelwork in this structure was clothed in reinforced concrete for fire protection. In addition to this building Messrs. Somerville have since completed two other similar buildings for the National Telephone Company.

Another contract carried out by Messrs. Somerville Co. shows the value of their hollow tile system as a sound proof medium, the entire railway cutting between James's Park and Victoria stations on the District Railway being roofed in. The sound of the trains since the completion of the work has been entirely deadened and the vibration reduced to a minimum, so much so that men's cubicles are being erected on the finished surface of the roof. Probably, from an engineering point of view, the most interesting piece of work carried out by this firm is the reconstruction of the town quay for the Southampton Harbour Board. This contract presented many engineering difficulties, as most of the work could only be constructed at low water. Several ingenious devices were employed which facilitated the work, among them the strengthening of the existing screw piles. These, amounting to nearly 200, each 30 feet long, were left in position, and concrete slabs were sunk round each through the mud to a solid foundation. Each section was forced into position by screw jacks, the mud being then forced out by water pressure and replaced by concrete, the whole forming a solid shaft 19 inches square. Mr. E. Cooper Poole, the harbour board engineer, is the patentee of this system of strengthening existing iron and timber piles. The contractors used the existing pile as a fulcrum to jack on to the concrete pile thus further facilitating the work. The piles then being brought up to the existing deck level, a new deck was formed in reinforced concrete, the whole being a monolithic mass. The deck before being taken over was tested at 10 cwts. per square foot, which load was twice the calculated safe load, no appreciable deflection being noticeable. Two heavy goods lines of railway were constructed on this deck and the whole finished in wood-block paving. Messrs. Somerville carrying out the whole of the work.

Among other contracts carried out by this firm in steel and concrete may be mentioned Chelsea town hall and Messrs. Rumpelmeyers's new premises St. James's Street.

MARSDEN TILES, LTD., of Burslem, have supplemented their catalogue by some separate sheets of Marsden tiles and slab panels. They also present briquettes in all colours, which can be applied to the construction of fire places with semicircular, segmental and flat arches, by which many pleasing effects can be produced, from dull glazed to rich lustrous. The slabs are adapted to the Queen Anne, Sheraton and Adams styles. Numerous as are the patterns of the tiles, there are no reproductions among them which are familiar, with one exception, that of simple fleur-de-lys. All the others are remarkable for their novelty, both in form and colour. It is not often so many gratifying examples of artistic invention and so strict exclusion of commonplace forms are to be found in a limited space. Messrs. Marsden's work deserves recognition and patronage, for it is manifest they encourage skilled artists, and adopt styles which are in keeping with decorative principles.

THE new catalogue issued by Marion & Co., Ltd., would have amazed Daguerre and Fox-Talbot. Neither of them could have imagined that so many appliances would come into the aid of a photographer and enable effects to be produced utterly beyond what was possible with their simple appliances, although directed by science and ardour. Everything requisite for the most advanced photography is in Messrs. Marion's catalogue. Cameras for all classes of work, lenses, dark-room lamps and sundries, appliances for printing, mounting and retouching; chemicals, albums, frames and much else will be found in the pages. Architects and engineers should also consider the various apparatus for copying plans; they are to be had at different prices according to sizes, the climax being found in the continuous rotary electric copying machine, which, amongst its advantages, makes prints of any length in one continuous piece, thus dispensing with the usual unsightly joints in drawings of large size, such as are required for railway plans and profiles and designs for bridges, ships, constructional work, &c.

## "CARRON" ELECTRIC RADIATORS.

THE Carron Company have introduced a series of radiators which diffuse a steady, healthy heat, and are equally suitable for office, club, shop or home where electricity is the lighting agent. The following are a few of the many advantages to be derived from their use:—No smoke, smell, ash, fumes or dirt; portable, easily fixed and require no attention; they give off a genial glow immediately electricity is switched on; cheap and effective, the consumption of electricity being approximately—4-light radiator, 1 Board of Trade unit per hour; 3-light radiator, 75 Board of Trade unit per hour. Glow lamps will burn about 1,000 hours without renewal. It is needless to say they are produced in a style which will satisfy fastidious critics, for that is a characteristic of all the company's grates and heating apparatus. The fronts are in repoussé copper or repoussé brass. Moreover, only a small space is occupied by one of the new radiators.

## THE LATE JAMES BEATY.

MR. JAMES BEATY, one of the most widely known builders and contractors in Carlisle and the neighbourhood, died on September 29 at his residence, The Grange, Carleton, says the *Carlisle Journal*, after an illness which had lasted for some time, but from which no fatal results had been anticipated. He was sixty years of age, and was the youngest of four brothers, all of whom were engaged in the building trade. The parents lived at Hutton Row, under Sir Henry Vane, as builders and contractors. James served his apprenticeship with his father as a builder, and when out of his time he went for improvement to Barrow and Manchester, after which he returned to Hutton Row and joined his father and three brothers, John, Peter and Thomas, as a partner in the building business. When the Midland Railway Company carried out the extension of their line from Settle to Carlisle the firm obtained the contract for all the building required on a section of the work. After the contract had been completed the father severed his connection with the firm, and in 1877 the four brothers

migrated to Carlisle and commenced business in the city as Beaty Brothers. Mr. James Beaty, soon afterwards withdrawing from the firm, commenced brick-making at Curthwaite, and lived there for some time. Succeeding Mr. Charles Armstrong as owner of the Kingstown brickworks, he left Curthwaite and came back to Carlisle and devoted himself with characteristic energy to the manufacture of bricks at Kingstown, enlarging and improving the plant and introducing modern methods of brick manufacture. He carried on this business throughout the remainder of his career. In addition to the business of brick manufacture he also carried on the business of a builder, and so extensive were his operations in that capacity that at the time of his death it could be said of him that he had probably built more houses in Carlisle and the neighbourhood than any other man. His biggest job as a builder was perhaps the theatre in Lowther Street. He erected the Home for Incurables in Wigton Road, and put up several schools in country districts near the city. The nature of the mark which he has left in the city may be imagined when it is stated that he built more or less extensively in the following streets:—Warwick Square East and Aglionby Street, Lawson Street (Newtown), Montreal Street Boundary Road, Goodwin Terrace, Esther Street, Brunton Avenue, Eldred Street, Toronto Street, Northumberland Road, Carlton Gardens (Stanwix), Lyon Road (Silloth), &c.

### LIVERPOOL MASTER BUILDERS' ASSOCIATION.

The forty-first annual general meeting of the Liverpool Master Builders' Association was held in the board-room of the Association, 24 Sir Thomas Street, on the 3rd inst. The chair was occupied in the earlier proceedings by the retiring president, Mr. William Bullen, and there were present many past-presidents, officers and members. The annual report dealing with various matters of importance to the trade, and the treasurer's statement of accounts for the past twelve months, were read and approved, and copies ordered to be supplied to every member, also to the various kindred master builders' organisations and all the local architects.

Mr. A. L. Haugh was elected president for the ensuing

twelve months, and he then took the chair and thanked meeting for his election. Mr. Charles Tomkinson, senior past president, proposed a hearty vote of thanks. Mr. William Bullen, the retiring president, who had occupied the chair two years in succession, during which years very many important matters had been dealt with and over 200 new members admitted to the Association. Mr. Tomkinson, acting as chairman of a special committee which had been appointed by the Association, asked Bullen to accept as an appreciation of his most valuable services, an illuminated address, and also asked Mrs. Bullen, through him, to accept a present from the Association in form of a silver rose bowl and side ornaments. Mr. J. S. Brown, a past president, in seconding the resolution, spoke very highly of the valuable services rendered by Mr. Bullen to the Association, and looked forward to the time when Mr. Bullen would occupy the chair of the higher branch of the builders' organisations to which this Association was affiliated. The resolution was carried unanimously. Bullen, in reply, accepted the gifts, and stated that the work had been a pleasure to him, and he was very pleased indeed that his endeavours were appreciated by the members.

The following further officers were then elected:—Frank Griffiths, senior vice-president; Mr. R. A. Art Costain, junior vice-president; Mr. Charles Tomkinson, treasurer; Messrs. H. E. Dallow and J. Sirett Brown, honorary auditors. Thirty-six members were then elected to form the Council for the ensuing twelve months. The Council is divided up into six trade committees representing the following branches:—Bricklayers, masons, plasterers and slaters, carpenters and joiners, painters, plumbers, glaziers and electricians' committees, each of these committees consisting of six members. A new rule was unanimously passed allowing the electricians six representatives on the Council instead of three as previously. On the proposition of Mr. William Bullen, seconded by Mr. Ernest Henshaw, supported by Mr. Charles Tomkinson, it was carried unanimously that the best thanks of the meeting be tendered to Mr. Bertram B. Moss, the secretary for his services during the past twelve months. A number of matters of general interest were discussed under "general business," and the meeting terminated with a vote of thanks to the chairman.

**NOTICE TO ADVERTISERS.**

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

**EDITORIAL NOTICES.**

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

**TENDERS, ETC.**

\* \* As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

**COMPETITIONS OPEN.**

ALTRINCHAM.—Oct. 21.—Proposed secondary school for Cheshire County Council. Architects desiring to compete should send their names by above date to Mr. J. Howarth, clerk, Education Offices, Market Street, Altrincham.

HERTFORD.—Nov. 30.—The Corporation of Hertford invite designs for the erection of offices at a cost not exceeding 3,500l. Premiums of 50l. and 20l. will be awarded. Particulars can be obtained from Mr. John H. Jevons, A.M.I.C.E., borough surveyor, Hertford.

WARRINGTON.—Nov. 30.—The Directors of Warrington Garden Suburbs, Ltd., invite architects practising within a 30-mile radius of Warrington and architects having previous experience in the planning of garden suburbs to submit competitive designs for laying-out their estates at Great Sankey and Morrisbrook Farm, Grappenhall. Conditions and particulars may be obtained on deposit of 1l. 1s. Mr. A. Bennett, Secretary to the Company, Market Gate Chambers, Warrington.

ACCORDING to an American consular report a law has been passed for the institution of an electric post in Naples, Milan and Rome, and the Italian Minister of Posts and Telegraphs has nominated a commission to arrange for the opening of bids for the installation of the service. The electric post, it is stated, is an invention of a Neapolitan, Baron Piscicelli-Taeggi, who has also patented it in America, and the invention renders possible the transmission of mails from one point to another with great speed. It is planned to reserve the electric post for the mails which have greater need of celerity, such as the transportation of special delivery letters and local telegrams to and from the central office and the sub-stations, as well as late matter, which could be sent from the central office to the railway station ten minutes before train time. The principal tube will be the one which connects the central office with the railway station, and if the service in the cities proves a success it is the ultimate intention to inaugurate a similar service between the principal cities in Italy. It is estimated that in this way the time between Naples and Rome can be reduced from five to two hours.

## TRADE NOTES.

MESSRS. PATMAN & FOTHERINGHAM, LTD., have been successful in obtaining the contract for the new College for Teachers of Domestic Subjects in Fortune Green Road and Hillfield Road, Hampstead, N.W., for the National Society. Messrs. Beazley & Burrows are the architects.

UNDER the direction of Mr. F. R. Bates, architect, Newport (Mon), the "Boyle" natural system of ventilation, embracing the latest patent "air-pump" ventilators, has been applied to the Brynmawr County schools.

THE British Flooring Co., of 152 Gray's Inn Road, London, W.C., who have several large contracts in hand for London, Birmingham, Wishaw, Sheffield, Wokingham, Brighton, &c., have appointed Mr. A. J. Vellacott, of Canada House, Baldwin Street, Bristol, as their representative for the West of England and South Wales.

WE understand that several "Secret Charge Weighing Machines" have recently been despatched to Rhodesia, different parts of Australia and Spain by Messrs. W. & T. Avery, Ltd., Soho Foundry, Birmingham. These machines are finding much favour where the different mixtures of a charge are required to be kept secret.

THE furniture employed in "The Sugar Bowl" at the new Queen's Theatre, Shaftesbury Avenue, was supplied by Messrs. Oetzmann & Co., Ltd. Besides that used in the reception-room and other interiors, it comprises cane, wicker and rustic furniture for the garden scene.

THE Bath Stone Firms, Ltd., have supplied the stone used in St. Stephen's Church, Swansea; the parish hall, Bishopston, Bristol; and the mission room, St. George's, Bristol.

A LARGE three-dial striking clock has been fixed at the Corporation Tramways Offices, Monkwearmouth, Sunderland, by Messrs. J. B. Joyce & Co., Whitchurch, Salop. The firm erected a large clock at the parish church, Sunderland, many years ago.

THE additions to the fever hospital, Falkirk, are being warmed and ventilated by means of Shorland's patent Manchester stoves, with descending smoke flues, the same being supplied by Messrs. E. H. Shorland & Brother, of Manchester.

THE Wedgwood School of Art, Burslem, which was erected at a cost of about 8,500*l.*, was opened on Thursday, October 10, by Mr. S. Gibson, the mayor of Burslem. The constructional steelwork, fire-resisting floors, wood-block floors and asphalt flats throughout were supplied and fixed by Messrs. Homan & Rodgers, of Manchester.

## DE LAITTE GAS.

WE published a description of the De Laitte system of producing an illuminant gas from oil on the 6th ult. and also of the gas plant by which thirty lights can be supplied although space occupied is only 2½ feet by 2½ feet by 4 feet. The limits of our space did not permit us to enter into all the details of the invention. On that account it has been supposed that in referring to the Glasscoe's patents last week we ignored what had been and is still done by the De Laitte plant. We were not comparing the two lights, and in both descriptions the aim was to suggest the essential qualities of what is obtainable by each process. With that intention there was no mention of oil or oil-gas in last week's notice. We are aware of the chemistry of gas-lighting, and from experience know that when dealing with any stage of the process, unless with the aid of chemical formulæ, which are liable to be misunderstood by the majority of readers, some liberality of interpretation must be allowed.

THE water committee of the Perth Town Council unanimously recommend the Council that the following works should be carried out in order to insure a satisfactory water supply on a practical and permanent basis, the total cost to reach about 15,000*l.*:—(1) New reservoir at Burghmuir, probable cost 6,264*l.*; (2) pump main for Burghmuir reservoir, probable cost 1,636*l.*; (3) extension of arm of filter tunnel and filter bed, above Perth bridge, probable cost 600*l.*; (4) extension of main filter tunnel, probable cost 600*l.*—total cost of above works, 9,100*l.* The enlargement of the Viewlands reservoir was also recommended, that work to be carried out at a later stage at a probable cost of 6,200*l.*

## The Leeds Fireclay Company, Ltd.

Head Office: WORTLEY, LEEDS.

BURMANTOFTS  
FIRE-PLACES.*Artistic. Decorative.  
Economical.*

These Fireplaces add distinction, refinement and cheerfulness to the apartment. The Faience and Fireback are of Fireclay, and act as radiators of light and heat. The grate is designed to give a maximum of heat at a minimum of cost and attention. Specially suitable for PUBLIC BUILDINGS, SCHOOLS, HOSPITALS, and PRIVATE RESIDENCES.

LONDON SHOWROOMS: 2 &amp; 3, NORFOLK STREET, STRAND, W.C.

LIVERPOOL: 21, Leeds St. BIRMINGHAM: 1, Edmund St. HULL: Alfred Gelder St., South Side, Queen's Dock.  
NEWCASTLE: 4, Northumberland St.

## VARIETIES.

THE directors of the London and Lancashire Fire Insurance Company have declared an interim dividend of 6s. per share (being at the same rate as the last interim dividend), payable on November 1, 1907. A similar interim dividend will also be paid on the shares of this company to be allotted to the shareholders of the Standard Marine Insurance Company, Ltd., as soon as practicable after the registration of their names in the shareholders' register of the London and Lancashire Fire Insurance Company.

THE Stepney Borough Council have decided to apply to the London County Council for sanction to borrow 57,000*l.* with which to undertake an extension of the electricity works, a step necessitated by the increased demand for current.

THE estate of the late Mr. S. J. Waring, of Liverpool, has been sworn at 78,785*l.* gross, the net personalty being 63,086*l.*

THE Kilmarnock Town Council have agreed to send modified plans for an infectious diseases hospital at an estimated cost of 14,748*l.* to the Local Government Board for approval.

THE monastic architecture of Burmah is aptly described and admirably illustrated in a well-written article entitled "The River of Pagoda Land," by C. E. Russell, which appears in the current issue of *Harper's Monthly Magazine*.

A RATEPAYERS' meeting, held at Matlock Bath on Tuesday, approved a scheme to put into operation Parliamentary powers to erect a pump-room and baths connected with the famous thermal springs there, and to build a pavilion, &c., costing 20,000*l.*

THE Southwark Borough Council are planting 166 trees in various streets in the borough. Some three years ago a forest nursery was laid out at the dust depôt, near Seven-oaks. Five hundred lime saplings were planted, and when developed sufficiently were transplanted to the local boulevards.

THE Dublin Corporation on Monday resolved "that in all contracts entered into by this Council a provision be included that trades union labour shall be employed in the carrying

out of such contracts; that all workmen in the service must be members of the trades unions attached to their several employments; and that instructions to this effect be forwarded to the secretaries of the standing committees for the instruction of the officers working under such committees."

MR. M. K. NORTH, one of the inspectors of the Local Government Board, attended on Tuesday at the Council House, Birmingham, and held an inquiry relative to the application of the City Corporation for sanction to borrow 81,900*l.* for the purpose of their electrical supply undertaking, 4,879*l.* for purposes of street improvement, 5,550*l.* for works of sewerage, and 1,600*l.* for the purchase of land in the urban district of King's Norton and Northfield, for the extension of Cannon Hill Park.

THE Local Government Board have declined to sanction a loan of 6,000*l.* for the erection of a town hall at Harwich on the ground that it is not necessary to erect a new structure, as all requirements could be met by making some internal alterations of the present Guildhall and erecting a courthouse and other offices on land adjoining, which has been acquired by the Corporation. The Council propose to send a deputation to interview the President of the Local Government Board on the subject.

APPLICATION is being made to the Local Government Board by the Beckenham Urban District Council for sanction to raise a loan of 1,000*l.* for the enlargement of the refuse destructor. In 1901, the first year of working, 6,507 tons of refuse were dealt with, and last year the amount had increased to 8,050 tons. It is proposed to add two cells to the existing three, and this it is estimated will meet the present difficulty and provide ample provision for the next five years.

A CONFERENCE of local authorities in the Black Country held in Birmingham last week decided to form an association, to be known as the Association of Midland Local Authorities, "principally for the purposes of developing local industries and promoting education and the public health and welfare, provided always that such an Association shall not in any way limit or control the right of any local authority to act independently of the Association in regard to any other matter referred to it."

## ILLUSTRATIONS.

CHURCH OF ST. ALBAN, BOURNEMOUTH.

CONVALESCENT HOME, HIGH BEECH, EPPING FOREST.

SUNDERLAND LIBRARY COMPETITION.—FIRST AND SECOND  
PREMIATED DESIGNS.

CATHEDRAL SERIES.—SOUTHWARK: THE NAVE, LOOKING EAST.

THE Ealing Metropolitan Borough Council have adopted a minute and recommendation of the works committee as to the National Registration of Plumbers furnishing the authorities and the public with a recognisable qualification or the plumbers they employ, coupled with a guarantee of the direct responsibility of registered plumbers for the due efficiency of their work, and referred the matter to the borough surveyor with a view to obtaining the necessary information as to registration lists.

MESSRS. LIPTON, LTD., have taken very large and commodious premises in a frequented portion of the Boulevard Haussmann, Paris, and will shortly inaugurate their spacious Salons de Thé." The decoration and furnishing is being done by Messrs. Waring & Gillow, Ltd., of Paris, and the installation of the tea and pastry kitchens, &c., by various Parisian contractors, all under the direction of Mr. 'ye-Parminster, architect, of Paris. The pastry ovens have been supplied by Messrs. Fletcher, Russell & Co., of London.

THE Middlesbrough Town Council have passed a resolution requesting the plans committee to prepare such amendments and additions to the building by-laws as will (1) permit the withholding of a certificate of habitation for any house until proper approaches have been made, (2) enable the Council to exercise control over the planning of new areas, (3) and generally promote the erection of more healthful dwellings. An addition was proposed to the effect that where it was found that the clauses mentioned could not be obtained without Parliamentary powers, that the matter be considered by the general purposes committee with a view to a petition being sent to the Local Government Board in favour of such powers being obtained, and this was agreed to.

THE Beath School Board have agreed to proceed with the erection of a school at the west end of Stenhouse Street, Cowdenbeath. Doubt had been expressed as to the advisability of erecting the building on a site where there was a possibility of danger from the underground workings. Such a contingency has been guarded against by the manner in which it is proposed to lay the foundations. The building will be one of two storeys, in the uppermost of which the Fife mining classes will be accommodated. Mr. Wm. Birrell, architect, Kirkcaldy, has been entrusted with the preparation of the plans for the new school.

It is probable that the electrification of the East London tramways along the Whitechapel and Mile End Roads will soon be undertaken. Hitherto the great stumbling-block has been the Stepney Borough Council, which would on no account agree to the installation of the overhead trolley system of traction. Since then, however, the County Council has proposed putting down the surface contact system. The works committee have intimated to the London County Council that they have no objection to any system of electric traction (other than the overhead) with the safety and stability of which the Board of Trade are themselves absolutely satisfied.

At a meeting of the executive of the Scottish National Exhibition held in Dowell's Rooms, Edinburgh, it was reported that the value of the space actually let amounted to 4,506*l.*, but every available foot had been applied for, and it is feared that many interesting exhibits may be crowded out. It has been decided, however, to recommit to the building committee the plan of the machinery hall, with powers to increase the size of the building considerably at a limited cost. Good progress has already been made with the industrial hall, the contractor for the work having been decided on some little time ago. The fine arts building and the concert hall will next be proceeded with, the plans of the latter having been completed.

THE plans for the new 10,000,000 dols. steel plant for the Minnesota Steel Company, Duluth, Minn., U.S.A., have been announced. The plant will be located on the Spirit Lake site, consisting of over 1,600 acres of land. The plant will include two blast furnaces; 160 by-product coke-ovens, with a capacity of 120 tons per day; seven open

hearth furnaces, with a capacity of 1,000 tons per day; one bloom mill, with a capacity of 1,000 tons per day; three finishing mills, with a capacity of 1,000 tons per day; several power stations, machine shops, foundry, pattern shops, electric repair shops, 100 tenement houses and twelve miles of standard gauge tracks in the yards and buildings.

MR. J. H. WORMAN, the United States consul at Three Rivers, in a report says that one of the most serious of the results due to the Quebec bridge disaster will be the delay caused in the completion of several railway connections badly needed for the opening up of the Lake St. John region and the territory to the north of it. He adds:—"Various industrial enterprises projected in this belt, enriched by vast forests yet untouched and streams affording water-power of priceless value, will have to be deferred for a year or more, as transportation facilities are wanting." The American concern in charge of the construction states that it will take two years to regain the condition that existed before the accident.

At the meeting last week of the Metropolitan Water Board it was reported that the tender of the Thames Ironworks, Engineering and Shipbuilding Company, Ltd., amounting to 49,653*l.*, for the provision of pumping machinery, &c., at Walton had been accepted by the works committee. That committee reported that the chief engineer to the Board had certified that Messrs. Pethick Bros. were not proceeding with their contract for the construction of filter-beds and other works at Long Ditton with such diligence as would insure their completion within the specified time, and the Board decided to determine the contract. Three of the beds should have been completed in July, and it was stated that at present not a single one was ready—a fact which would have placed the Board in a difficulty had the summer been dry.

THE streets and buildings committee of the York City Corporation report that the sub-committee appointed to consider the question of the proposed new street from Pavement to Piccadilly had considered the whole question with regard to the property to be acquired, and in certain instances had been able to obtain a reduction of price asked for, also that they had spent a considerable time in

inspecting the route, and had decided not to proceed present with the widening of the existing street called Piccadilly. The sub-committee also stated that they had considered the question as to what the surplus land would realise and also the net cost of the scheme. The committee eventually decided to report to the Council that the gross cost of the scheme would be about 40,000*l.*, and the net cost between 23,000*l.* and 24,000*l.*

THE United States Consul stationed at Bamberg, Germany, in a report says that the over-supply in the labour market has disappeared, and a scarcity of help has set in. Such a condition has not existed since 1900, and only in 1899 was the scarcity of labour felt more than now. Nearly all the important iron industrial centres report a shortage of workers. The building branch alone suffered a relapse in activity, due mainly to inclement weather, stress in the money market and strikes. The mining business has improved so much that employment has been found for many unemployed building men, yet the mines are nowhere sufficiently employed.

SEWAGE purification works for Galston, N.B., will formally opened on Tuesday. The work was rendered necessary by pressure from the County Council, who insisted upon proper measures being adopted by the burghs in the upper reaches of the Irvine to prevent the pollution of the river. The works are situated at Goatfoot Rows, about a quarter of a mile below the town, and at present are arranged to purify the sewage from a population of 5,000. Sufficient space is, however, provided in the site to allow of the capacity being doubled. The treatment adopted is the modern bacterial system of liquefying or septic tanks and percolating bacterial filters. The tanks are three in number and have a holding capacity of 150,000 gallons. The outlets of the three tanks are all discharged into one chamber, in which a mercurial-balanced valve, actuated by a float, intermittently delivers the liquid to the three filter tanks. The whole scheme is designed on automatic principle. The work was carried out by Mr. James Steel, contractor, the engineers being Messrs. Elliott & Brown, C.E., Nottingham.

A REPORT on their proceedings under the Conciliation (Trades Disputes) Act, 1896, has been issued by the Board.

f Trade. In accordance with custom it deals with the work of two years—from July 1, 1905, to June 30, 1907—and gives particulars of each case in which the assistance of Board of Trade arbitrator has been sought. The results are summarised in a brief introductory note by Mr. A. Wilson Fox. The number of cases dealt with in the two years covered by the report was fifty-one, of which no fewer than twenty-three occurred in the last six months of the period (January to June 1907). The number of cases in which stoppage of work occurred was sixteen. Of the fifty-one cases dealt with in the two years under review, fourteen arose in the building trades.

His Honour Judge Shand delivered judgment on the 5th inst., at Liverpool County Court, in the case of Edward Hute, a joiner, living at Birkenhead, and the Liverpool Cotton Association, Ltd., which was a claim under the Workmen's Compensation Act. It appeared that on May 22 last the applicant was engaged fixing picture moulds in the new Cotton Exchange at Liverpool, being then in the employ of the respondents. He was standing on a plank between two trestles when the plank canted and he fell, juring his right ankle and knee and breaking his left leg, and was incapacitated from work for some time. The only question for the decision of the Court was whether the fixing of the picture moulds was an employment on in or about a building which exceeded 30 feet in height, and was being constructed or repaired by means of a scaffolding. His Honour held that the putting in of the picture moulds as an integral part of the structure of the building and something in the nature of construction, and he therefore gave an award in favour of the applicant.

Mr. ALBERT HALSTEAD, United States Consul in Birmingham, has reported to his Government that two Americans who have been employed in a tube factory in the vicinity of Birmingham have patented an improved method for the manufacture of welded iron and steel tubes. It is claimed that the patent, which is already in successful operation in the district, not only assures a more perfect weld, but permits of great economy in the making of tubes. The process consists of blowing cold air, or air and gas, upon the edges of the steel or iron strip which is to be welded. In practice the air blast alone is used, because it is regarded as better, but a combination of air and gas can also be

employed. The effect of the air blast upon the iron or steel bar, which is drawn through the furnace at what is regarded as welding heat, is similar to that of blowers on coal or wood—it more than doubles the temperature of the edges. The air blast while heating the edges of the strip to a greater temperature, through the mixture of the oxygen in the air with the impurities in the steel and iron, leaves a perfect edge. The process can also be applied to the method of manufacturing butt-welded iron and steel tubes by squeezing the edges of the heated strip or skelp together with tongs as it is drawn from the furnace. This invention is said to obviate the loss that sometimes occurs when the strip buckles because too hot, or is burned by the excessive heat.

THE cement industry in Japan has made marvellous progress of late years. Since the early years of Meiji down to 1880 the annual importation of the commodity averaged about 150,000 yen in value, but now about 450,000 yen worth of home product is being annually exported. A cement factory was first established in Japan in 1871 by the now defunct department of public works, but it was not until 1882 that a private factory was installed at Osaka, this being followed by the installation of the Onoda cement factory in 1883, and two years later by the Asano cement factory which succeeded to the Government enterprise in Tokio. In 1883 the Hashimoto cement factory was inaugurated in Fukugawa, Tokio, and the Aichie cement factory came into existence two years later, closely followed by the factories set up in Shidzuoka, Osaka and other prefectures until the present prosperity of the industry has been attained.

#### FARNHAM CLEANSING.

THE great trouble with architectural works in the Metropolis and large manufacturing towns is to restore them to some measure of their pristine beauty, after the smoke and dust and chemical elements too numerous to mention have to some degree effaced them. One of the most recent and modern processes, operated on one of the largest buildings in London, it has been our pleasure to witness in the restoration of the brick and stone façade of Lipton's, Ltd., in the City Road. The process has few, if any, of the objectionable

points of its competitors. There is nothing of the hissing steam and oil-skinned attendant. All is quiet and business-like. The results are very good. The system is that of the sand-blast, but particularly manipulated for the class of work in hand. Skilled operatives are employed and the system itself is ingenious. An electrically worked vacuum pump forces the air, regulated according to the degree required, into a chamber in which a sand supply, also regulated, is arranged. This is taken up by flexible

the Farnham Company are to be congratulated on unqualified success of this most modern and improved method.

### THE QUEBEC BRIDGE.

It is difficult to realise from words the extent of the disaster to the Quebec bridge, which as a Canadian work must have been of great interest for Englishmen. Although there is not as much unanimity about the true cause of the collapse, it is admitted

pipes to a reducing nozzle, and when delivered simply makes the front of the building, brickwork or stone, resplendent as new. Every particle that obscures the work is cleaned off, and it is left clean and sharp as well as when it was first executed. The softest materials and even the hardest stones succumb to this method of treatment, and

that the constructive work was excellent, and the special illustration we give manifests that although there was distortion of some of the parts, absolute breakage did not arise. That the steel should be subjected to enormous strain was inevitable, but the resistance increases the mystery which surrounds the initial weakness.

**A MÆDIEVAL CEREMONY AT LANCASTER.**

THE new Constable of Lancaster Castle (Sir John T. Hibbert) was installed in his office last week with old-time ceremony. Although within the castle things might be stirring enough, says the *Manchester Guardian*, there was little from without to show that anything unusual was happening, a dozen police patiently keeping the great south-eastern gate. To this gate had the new Constable come, and with him many public men of the county. They had walked in procession from the plain old house down the hill, the Judges' lodgings. Four loud knocks on the gate must every new Constable give before it can be opened to him. These were given; then the door was opened by the Governor of the castle and the little procession went within the walls.

A tiny door in the gate now opens to one's knocking, and at length one is let in. Within the castle yard uniformed warders point out a small door at the foot of a turreted tower, and one seeks to hasten up the winding stone stairs to which it leads, so as to catch up with the ceremony that is going on above. But to hasten leads only to a bumped head and barked shins; for the steps are narrow and deep-worn, ever winding like a corkscrew, and there is alternating night and day to confuse the eyes—day for a few steps as one passes long narrow slits in the massive stonework, then night, with only candles in lanterns on the walls to guide. But the top comes at last—a narrow passage with rooms opening off it. The first of them is filled with people and speaking can be heard. This is the Constable's room. In time past it was John o' Gaunt's, and since that day, in spite of its bare stone walls and floor and plain beamed roof, several kings have used it. There is a bright red fire in the grate now, casting a pink glow and shadows on the walls, and two lamps hanging on wires from the beams above and the tiny grated windows at each end of the chamber make a soft light in the place. One can for a moment almost think that it is still John o' Gaunt's room. But it is only for a moment. The cut-glass inkstand near the Constable's chair is wrong, the circular-wicked paraffin lamps are wrong, and the frock coats of the men are an insuperable anachronism.

The new Constable has been led here to receive the keys of the castle and to declare his willingness to under-

take the duties of the office. The King's patent was read "hereby appointing our right trusty and well-beloved Councillor Sir J. T. Hibbert to be Constable of our Castle at Lancaster, with the appurtenances thereto belonging," and after Sir John had declared to the Lord Lieutenant of the county his willingness to fill the post he was escorted to the Constable's chair by Lord Derby and the High Sheriff. The massive keys of the castle were then handed to him by the Governor, into whose keeping Sir John Hibbert returned them. They could not, he said, be in safer hands. Congratulatory speeches were made, and the new Constable thanked the speakers. He then spoke of the history of the castle and of the post he now filled. Time was, he said, when the Constable had much to do, for which, no doubt, he received an adequate payment. Now there was no payment attached to the post, for, as a matter of fact, there were no duties attached to it. He hoped, he concluded naively, that he should perform them well.

After a record of the installation had been signed those present clambered down the winding stairs as best they could, and at the little gate at the bottom formed into procession again and walked round the castle to the more modern shire hall. On the walls of this chamber hang 234 wooden shields bearing the coats-of-arms of all the constables of the castle there have been since 1689. There are too the javelins of many high sheriffs. Among the shields are larger ones bearing the arms of the monarch reigning at the time each shield was hung. Sir John's shield was handed to the Governor and hung immediately under that of King Edward VII. More speeches were made, and after cheers had been given for the new Constable and for the King the ceremony was at an end.

**FIRE RISKS AND LARGE BUILDINGS.**

THE fire brigade committee of the London County Council have reported as follows on the contemplated increase of the cubic extent of buildings:—

We have considered further the proposals of the Building Act committee for the amendment of the provisions of the London Building Act, 1894, relating to the cubical extent of buildings. We have also conferred with that committee as to the regulations that should be adopted

in dealing with cubical extent applications if the proposed amendments become law. So far as the suggested regulations are concerned, there is little difference of opinion between us and the Building Act committee. We recognise that it may be necessary in certain trades and manufactures to have buildings of larger cubical extent than the present law allows, but at the same time we feel bound to inform the Council that in our opinion the erection in London of buildings of great cubical extent, not subdivided by party walls, cannot fail to expose London to the risk of conflagrations such as have occurred abroad, no matter how stringent may be the regulations governing the erection of such buildings. The chief officer of the fire brigade has impressed this upon us very strongly, and has pointed out that the strength of the brigade will have to be very considerably augmented to cope with the increased danger from fire. The danger would of course be enormously increased if proper precautions were not always insisted upon, and we therefore think that it is essential that the regulations which will govern the erection of buildings of large cubical extent, if the law is amended as proposed, should be inserted in the Act, and we have accordingly requested our chairman to move an amendment to this effect to the recommendation of the Building Act committee.

### ADMIRALTY DOCK, PORTSMOUTH.

The necessity of constructing immense vessels of the *Dreadnought* type compels the addition of a new and special dock to those of Portsmouth. Plans have been received by the dockyard authorities, and the quantities are being got out. The work is to be done by contract.

The new lock is to connect the harbour with No. 4 Basin. This will involve the doing away with the present coaling depot, for the western entrance is to be at the point of land that forms the northern side of the tidal basin. From there the lock will take in a part of No. 3 Basin, and enter No. 4 Basin at the southern side. The total length will be not far short of 900 feet. The width will be a little over 100 feet, and the depth from the coping to the bottom between 50 and 60 feet. The depth of water at ordinary high tides will be 35 feet, and at spring tides there will be a

depth of some 3 or 4 feet more. The scheme which the Admiralty have approved covers not only the construction of the lock itself, but also the removal of a portion of the wall between Basins Nos. 4 and 5, although the latter work may not be carried out concurrently with the main part of the scheme. This widening of the connections between Nos. 4 and 5 Basin is to be carried out so as to facilitate the transfer of vessels from one basin to the other. At both ends the lock will have sliding caissons, the machinery for the opening and closing of which will be operated by compressed air or electric motors. There are to be culverts for emptying and filling the lock, and these will be connected with the main pumping station; but although it will be possible to utilise the lock as an ordinary dock there is no intention of ever doing so. The sole idea is to provide a ready means for enabling the largest battleships or cruisers to enter the basins at any state of the tide, which they cannot now do. The great length and width will enable a *Dreadnought* or a *Warrior*, or the largest warship at present projected or likely to be projected, lying easily in this huge waterway. It is intended to erect a 160-ton crane alongside of it, and besides this all the requisite appliances, in the way of capstans, &c., will also be provided.

No. 3 Basin has been cleared of ships, and it will probably be pumped dry so that the outer walls may act as dams while the work of construction is in hand. A large dam will have to be constructed at the western entrance and another at the eastern end, where the lock enters No. 4 Basin. Excavations have been made at the coaling point to the depth of rather more than a hundred feet, and similar borings have taken place in the basin on what will be the site of the northern wall of the lock, and the results have fully satisfied the engineers as to the reliability of the site so far as the foundations for the masonry are concerned. The work will be of a very substantial nature and it will take about three years to complete. About half of the present area of the basin will be left. This it is intended to utilise for small craft and an entrance will cut through into the Fountain Lake.

The estimated cost of the lock is 940,000*l.*, with an additional 60,000*l.* for machinery, making a round million altogether, but, as stated, of this only 20,000*l.* is to be

# TONKS LTD.

## MOSELEY ST., BIRMINGHAM.

### PUBLIC

### LIGHTING

Drawings and Prices of specially designed fittings in any period will be sent on application.

Architects' Specifications for Public or Domestic Lighting carefully carried out.

expended during the present financial year. For the 160-ton crane 8,000*l.* has been allowed for the foundations and 24,000*l.* for the machinery, but of those amounts only 4,000*l.* has been set aside in the present estimates.

### WORKS IN SHEFFIELD.

THE city surveyor of Sheffield (Mr. C. F. Wike) in his annual report says there are in the city 290.98 miles of adopted streets and 101.43 miles unadopted. The roads paved with wood for the whole or a portion of their width have a length of 14 miles, and probably not more than one or two provincial towns have anything like this mileage of wood paving. A great part of it was laid eight or ten years ago and renewals are now becoming a heavy item. There is one feature which is very satisfactory. The Local Government Board fix the life of wood pavement at five years, or at any rate they allow only five years for repayment of a wood pavement loan. Generally the life is calculated by authorities at seven years, and the fact that a good deal of the wood in Sheffield has lasted eight years, and some ten years, is very satisfactory.

Since March 1899 no less than 36½ miles of rubble sewers have been reconstructed, and there are still about 40 miles needing attention. Of this total 8½ miles are included in the current estimates, or included in loans applied for.

The work of reconstruction of sewers has been greatly delayed by the action of the Local Government Board. They declined to sanction a loan of 8,040*l.*, applied for in November 1906, on the ground that it included wages to be paid to permanent employés of the Corporation. To meet this objection the highway committee have offered to engage a special staff of men, and it is thought in this way the objection may be overcome.

An average number of 1,511 workmen per week has been engaged by the department. The highest number any week was 1,988 and the lowest 1,266. The wages have amounted to 99,736*l.*, including team work.

This year the regulation of the Council entitling regular employés to one week's holiday will come into force. The number of men working under the department who will

benefit is 1,142. The length of service of these men is:— 20 years' service and upwards, 80; 15 to 20 years, 132; 10 to 15 years, 206; 5 to 10 years, 452; less than 5 years' service, 272. These figures are of particular interest at the present time in view of certain statements which have been made as to the temporary nature of the employment afforded by the highway department, and it is questionable whether many other undertakings or firms could show a better record than this.

There has been an increase in the length of new streets and sewers approved, the figures being greater than for any year since 1899. This is an encouraging feature in one way, but it accentuates the difficulty which is felt in respect of town planning. In some cases every disposition has been shown to meet the Corporation in the laying-out of estates, but in others the governing principle has been to lay out the land so as to get the largest number of house plots and the greatest possible ground rent, little or no regard being paid to the general requirements of the neighbourhood in which the new streets are situate. Every care has been taken to suggest improvements where these appeared necessary, and all reasonable pressure has been exercised to get the suggestions carried out, but the result on the whole has not been very satisfactory. This subject will no doubt have to be dealt with in the near future, and a very strong case can be made out to show that in Sheffield further powers to regulate town planning are needed.

There are in Sheffield upwards of 35 miles of streets carrying tramways—5 miles 2 furlongs 6 chains of single track and 30 miles 4 furlongs 4 chains of double track, equal in all to about 66½ miles of single track. The cost of renewals during the past year has been greater than in any preceding year, but, says the city surveyor, that is only what must be expected. The cost of repairs, however, has been reduced, and stands at the very low figure of .249*d.* (almost exactly a farthing) per mile. This is regarded as very satisfactory. The total cost of repairs for the year was 7,079*l.* and renewals 12,073*l.*

A lengthy reference is made to the relaying of the trams on Sheffield Moor, work which was done with such remarkable expedition. The total amount expended on sewerage, tramways and paving was approximately 11,500*l.*

# DURESCO

## THE KING OF WATER PAINTS.

SOLE MANUFACTURERS—

## THE SILICATE PAINT CO.,

J. B. ORR & CO., Ltd.,

CHARLTON, LONDON, S.E.

Projected tramway work includes a line and junctions along Leopold Street, a line from Chantrey Road to Abbey hotel at Woodseats, extension from Cemetery Road along Psalter Lane to Banner Cross, a line from Rustlings Road to Carterknowle Lane at Ecclesall, extension from Holme Lane to Malin Bridge at Hillsborough, a line from Brightside Lane to Wincobank, extension of the Firth Park section to Bellhouse Road and a new line from Darnall to Handsworth Hill.

The laying-out of the land at High Wincobank for the Model Cottage Exhibition threw a large amount of work on the architectural department. The total cost of the seventy cottages is approximately 13,004*l.* for buildings and fittings, 5,994*l.* for site and costs of acquirement, and 1,915*l.* for street making and sewers. This gives a total of 20,913*l.*, an average of 299*l.* per dwelling.

The number of houses erected and certified for occupation in the city during the year was 1,904.

Abyssinia Bridge is to be widened at a cost of 5,000*l.*

The cost of the work in Fitzalan Square is estimated at 11,168*l.* On the Baker's Hill side the Square has been levelled up. Baker's Hill has been closed as a thoroughfare, and a stepway from the Square now leads to the street below.

Progress has been made with the scheme for making a new street from Waingate to the Victoria station. In April last the gross expenditure was approximately 140,000*l.* Claims settled since then amount to 50,500*l.* Plans have now to be prepared for the new bridge over the Sheaf.

The cost of improving the parish churchyard, including the widening of the street, was 2,360*l.*

#### TAR ON ROADS.

In his report on the road-tarring experiments carried out recently at Aberlady and Gullane Links, in East Lothian, Mr. John Robb, the road surveyor, says:—"In carrying out these works, 7 gallons tar per cubic yard were used, and the cost per cubic yard finished was 3*s.* 5*d.*, or 2*s.* 4*d.* more than by rolling in the ordinary way. In this charge, however, is included the cost of gravel and sand, as such

material is not used in ordinary rolling, but this material should probably be charged to the metal account. The appliances for spreading the tar were rather primitive and not conducive to economical working. A spraying machine would save a large amount of manual labour. I should also point out that the roller cannot consolidate more than 33 cubic yards per day, instead of about 56 cubic yards by the ordinary method. Should it be decided to continue the experiment, from the experience gained I feel sure the work can be done cheaper. The total cost of the experiment has been 62*l.* 10*s.* In Aberlady a portion of the road surface at both ends of the coating was tar painted only. The tar was applied and well brushed in. The area so treated was 1,171 superficial yards, and the quantity of tar used was 260 gallons, or 1 gallon tar to 4½ superficial yards of road. The cost was practically 1*d.* per superficial yard, and this includes the cost of cleaning and sanding the road. While the cost of repairing a road by this method is high, I am satisfied the life of a road so repaired will be considerably prolonged and the extra expenditure in towns and villages will be justified." The County Council were satisfied with the experiment, but decided to wait till after winter before doing anything more.

#### BUILDINGS TO BE ERECTED.\*

WORKING-CLASS dwellings at Prospect Terrace, Paddington (Messrs. Joseph & Smith).

Addition to mission buildings, Harroway Road, Battersea (Messrs. W. & C. A. Bassett Smith).

Office and shop, High Street, Lewisham (Mr. A. L. Guy).

Porches to eighteen houses, Upper Tooting Park Road, Wandsworth (Mr. E. Evans).

Building on south side of Drysdale Road, Hoxton (Messrs. Lovegrove & Papworth).

Buildings in Tollington Park and Pine Grove, Islington (Mr. E. D. Hoyland).

Re-erection of Waterman's Arms, Dockhead, Bermondsey (Mr. W. Stewart).

## THE SOCIETY OF ENGINEERS.\*

THE author, in his opening remarks, states that by "liquid fuels" it is implied that the fuels described enter the engine mechanism in a liquid as distinct from a gaseous state. He proceeds to point out the advantages of the adoption of large "heavy-oil" engines for marine purposes as compared with gas-producing plant and gas-engines.

A short synopsis is given of what has been accomplished by makers of heavy-oil engines and paraffin engines, and the two methods of carburetting air by means of paraffin are discussed. The necessity for an accurately measured feed of oil for each working stroke, as distinct from the utilisation of a spray carburetter, is discussed.

The author shows why the specific gravity of petrol has increased during recent years, and how carburetters could be modified to satisfactorily utilise petrols of even a greater density than those now on the market.

Distillation tables and the points of difference between what are known as "heavy" and "light" petrols, with their chemical compositions and boiling-points, are given.

The author also gives the results of a number of experiments he has made during the last two years upon petrols of various densities, and mixtures of petrol and paraffin. The advantage of the adoption of a spirit of a greater specific gravity than 0.720 is clearly demonstrated.

Explosive mixtures are discussed in detail and the proportions are given of petrols of various densities, which produce the best explosive mixtures with air.

Other tables show the results of some of the author's experiments upon the rate of evaporation of various petrols and the effect of heat and air currents. These show that higher temperatures materially affect the rate of evaporation of petrols of greater density, whilst the effect of air currents is less marked. Results of road tests upon carburetter loss and strength of explosive mixture are compared with those put forward theoretically and as the result of laboratory experiments.

The author gives notes upon the sources of supply and

prices of petrol and the causes of the unstable state of the petroleum market. The necessity for some alternative fuel is considered and some results of the author's experiments with benzol and alcohol are given in tabular form. The results of the benzol tests are very satisfactory; the distance covered by the car per gallon of fuel shows a marked increase as compared with various brands of petrol.

Alcohol was tested when mixed with a proportion of another liquid fuel and without any alteration to the engine. The results obtained show great promise for this fuel, and enable the author to refute statements which have been made with regard to alcohol being an impossible fuel for a motor-car engine.

## MANCHURIAN CLAYS.

THE Acting British Commercial Attaché at Pekin has forwarded a copy of an extract from the *Harbinsky Vestnik* dealing generally with Manchurian clays and their composition, from which the following particulars are extracted:—

*Fire Clay.*—This clay is found in Manchuria along the banks of many mountain streams of the Syaolin ridge, and in the western slopes of the Greater Hsing-an Mountains, and is composed of two kinds:—(a) A white pure porcelain clay suitable for the finest work, for instance china-ware; and (b) a light yellowish or reddish fire clay suitable for making fireproof material, such as fire-brick, &c.

Fire clay is also known to exist along the Sungari and Utsimi rivers, and in the Ussuri district along the Mo and the Lephu rivers.

*Fusible Clay.*—This clay is found in different parts of South Manchuria. It is soft and in admixture with water is highly plastic and easy of dissolution. Its colour is bright red or yellow. Many of the different kinds of this clay represent very fine material for the removal of grease spots, and can, therefore, be used as cloth-rolling clay.

*Brick Clay.*—Of the different clays this is most common, and its use has been well developed in making building material for small Chinese shops and stores in the larger centres of Manchuria, especially in the vicinities of Harbin, Tsitsihar, Hailar, Handaohedze and Pogradichnia, also near Vladivostock and Nikolsk in the Primorsk.

\* A paper on "Liquid Fuels for Internal Combustion Engines," read on Monday, October 7, by Mr. Robert W. A. Brewer.

## THE "DRAWWELL" GRATE

WAS PLACED

## First in the Final Tests

at the recent test with Firegrates at the New Government Offices in Whitehall, under the direction of a sub-committee of the Coal Smoke Abatement Society, in conjunction with Sir Henry Tanner and a committee of experts, for smoke abatement, heating power, fuel economy, and suitability for public and private buildings.

**N.B.—All Grates bear the Trade Mark and Name of "Drawwell" on firebrick to insure against imitation.**

This Grate can only be supplied through Builders' Merchants, Ironmongers, &c., but Drawings and Particulars can be obtained from

**J. & R. CORCKER, Ltd.,**

GENERAL IRONFOUNDERS, Ferham Works, ROTHERHAM.

London Showrooms, Saracen's Head Buildings, Snow Hill, City,

W. B. CLARKE, Agent, where the "Drawwell" can be seen in action.

Along the Sungari and Nonni rivers there are many deposits of sandy and blue clays. In the sandy clay deposits along the Nonni are found gold leaves, indicating that the deposits have their origin from the stream.

In addition to other clay-silic compositions, Manchuria has many deposits of clay and lime marl, some of which are very valuable as material for the manufacture of cement.

Rotten-stone is found between Imenpo and Utsimi and along the Eastern branch of the Eastern Chinese Railway. This material is used in large amounts in the manufacture of dynamite, ultramarine, crystal glass, enamel and glazing; for polishing and cleaning; the manufacture of sealing-wax, paper and soap; and for making light brick and cement for stone.

The Acting Commercial Attaché states that the rotten-stone referred to in the last section is understood to be the Kieselguhr deposit between Imjanpo (Yi-mien-p'o) and Uzeima (Wu-chi-mi), which lie a little to the east of Ashiho on the Chinese Eastern Railway to the east of Harbin.

### PROPOSED WORKS IN MANCHESTER.

A MEETING of the general purposes committee of the Manchester Corporation will be held on Wednesday, October 16, for the purpose of considering the report of the Parliamentary sub-committee, which recommends that a Bill be promoted in the next session of Parliament for the following objects:—To authorise the construction of additional works at the Woodhead and other reservoirs of the Corporation at Longdendale. To authorise the acquisition or appropriation of lands and premises in Moston Lane, North Manchester, for the purpose of making that street 16 yards wide. To confirm, give effect to and authorise arrangements with the Manchester University for the stopping up (wholly or partially) of Coupland Street or part thereof, and the provision of a substituted street 16 yards wide in continuation of Bridge Street, and to authorise the acquisition of lands in connection therewith. To authorise the construction of sewers and works in the city and in Stretford, including works in connection with Brook's sewer, the Manchester Ship Canal and the

main outfall sewer of the Corporation. To extend to the city generally the statutory exemption of libraries from parochial rates which exists in the township of Manchester. To alter and amend the County Borough of Manchester Order, 1896, so as to enable the Corporation to erect one library near the boundary of the districts of Cheetham and Crumpsall, instead of one in each of those districts as required by the Order. To authorise the construction of tramways in Princess Road, Moss Side, and for other general purposes. The additional works recommended by the waterworks committee for dealing with floods are estimated to cost 137,000*l*.

### RIGA TIMBER.

THE effect of extreme competition is illustrated in Mr. Consul Wodehouse's report on the trade and commerce of Riga for the year 1906. The chief competitor of Riga whitewoods in the markets of the United Kingdom is Canadian spruce, but the demand of the United States for Canadian spruce has lately been very large, and prices have ruled so high that spruce shippers have been obtaining in the United States the equivalent of about 8*l*. 10*s*., 8*l*. 15*s*. c.i.f. London for 3 by 8 and 3 by 7 unsorted. Riga exporters seem to have ignored this fact. They commenced selling on a basis of from 8*l*. to 7*l*. 15*s*. for the above dimensions, and by their competition with one another succeeded by the month of April in enabling the United Kingdom buyers to purchase from them at 7*l*. 6*s*. 3*d*. c.i.f. goods which they could not obtain elsewhere—that is, from Canada—under at least 8*l*. 10*s*. to 8*l*. 15*s*. c.i.f. Mr. Wodehouse explains this by saying that the Riga exporters of sawn goods are a badly organised body. They tackle more goods than they can comfortably finance. Their one idea seems to be to turn out as much stuff as they can and get it shipped off before the winter comes, so as to have less stock to finance over during the closed time of winter. The result is that through fear of not clearing their production of the summer and autumn, before the winter comes, and easing themselves financially by getting their money back, they operate one against the other in making sales and forcing the foreign markets.

**EDITORIAL NOTICES.**

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

**TENDERS, ETC.**

\*\* As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

**COMPETITIONS OPEN.**

HERTFORD.—Nov. 30.—The Corporation of Hertford invite designs for the erection of offices at a cost not exceeding 3,500l. Premiums of 50l. and 20l. will be awarded. Particulars can be obtained from Mr. John H. Jevons, A.M.I.C.E., borough surveyor, Hertford.

SUNDERLAND.—Nov. 5.—For erection of branch library in Vilette Road. Deposit 2l. 2s. Messrs. Davidson & Cratney, architects, 22 Fawcett Street, Sunderland.

THURLSTONE.—Nov. 25.—The Thurlstone Urban District Council invite plans for council-room, offices, caretaker's house and outbuildings (cost not to exceed 650l. for building and heating apparatus only). For instructions and particulars apply to Mr. J. Wadsworth, clerk, Thurlstone, near Penistone.

WARRINGTON.—Nov. 30.—The Directors of Warrington Garden Suburbs, Ltd., invite architects practising within a 30-mile radius of Warrington and architects having previous experience in the planning of garden suburbs to submit competitive designs for laying-out their estates at Great Sankey and Morrisbrook Farm, Grappenhall. Conditions and particulars may be obtained on deposit of 1l. 1s. Mr. A. Bennett, Secretary to the Company, Market Gate Chambers, Warrington.

**CONTRACTS OPEN.**

BARNET.—Nov. 9.—For construction of foundations, drains, roads, fences, water supply and other works (not including the structure) in connection with isolation hospital to be erected in Mays Lane. Mr. H. F. Traylen, architect, 34 Great James Street, Bedford Row, London.

BATLEY.—Oct. 29.—For erection of steam laundry at Bradford Road. Messrs. R. Castle & Son, architects, London City and Midland Bank Chambers, Cleckheaton.

BOURNEMOUTH.—Nov. 4.—For erection of elementary schools in Middle Road. Deposit 2l. 2s. Mr. F. W. Lacey, architect to Education Committee, Municipal Office, Bournemouth.

"BRIGHTSIDE"  
PATENT CALORIFIER.

**PATENT CALORIFIERS**

(NO STEAM TRAP REQUIRED)

For HEATING APPARATUS and HOT WATER SUPPLY.

**THE BRIGHTSIDE FOUNDRY & ENGINEERING CO.**  
LIMITED,

SHEFFIELD, & 28 VICTORIA STREET, LONDON, S.W.

PRICE LIST ON APPLICATION.

"BRIGHTSIDE" PATENT CALORIFIER.

BRIDLINGTON.—Oct. 29.—For erection and completion of detached residence, Cardigan Road. Mr. J. Earnshaw, architect, Carlton House, Bridlington.

BRIGHTLINGSEA.—Nov. 14.—For erection of a police station at Brightlingsea, Essex. Deposit 10*l*. Mr. F. Whitmore, county architect, Duke Street, Chelmsford.

CHURWELL.—Oct. 31.—For various works (except plumbers') required in alterations and extensions to warehouse and offices at Millshaw leather works, Churwell, Yorks. Messrs. T. A. Buttery & S. B. Birds, architects, Queen Street, Morley, and 1 Basinghall Square, Leeds.

COLCHESTER.—Oct. 26.—For erection of a detached house on Lexden Park estate. Messrs. W. Mortimer & Son, architects, Lindum Chambers, Romford.

CUBBINGTON.—Oct. 26.—For erection of a clubhouse at Cubbington, Warwickshire. Mr. Francis P. Trepass, architect, 1 Church Street, Warwick.

DARTFORD.—Oct. 28.—For erection of a temporary corrugated iron wood-sawing shed and latrines, also supply of galvanised iron sheeting and timber for fencing and lean-to sheds. Messrs. Tait & Hobbs, architects, Dartford.

DUBMIRE.—Oct. 29.—For erection of Council school at Dubmire, near Fence Houses, Durham. Messrs. J. Potts & Son, architects, 57 John Street, Sunderland.

EDINBURGH.—Nov. 1.—For erection of concert hall at Saughton Park for exhibition of 1908. Deposit 1*l* 1*s*. Mr. James D. Gibson, surveyor, 60 Frederick Street, Edinburgh.

GLASGOW.—Oct. 28.—For steelwork in reconstruction of Cathcart Road bridge, on the Pollok and Govan line, for the Caledonian Railway Co. (Western District). Deposit 2*l* 2*s*. The District Engineer, 3 Germiston Street, Glasgow.

GOLCAR.—Oct. 26.—For the erection of stables, &c. Messrs. Lunn & Kaye, architects and surveyors, Milnsbridge and Huddersfield.

HARLOW.—Nov. 14.—For erection of police station at Harlow, Essex. Deposit 10*l*. Mr. F. Whitmore, county architect, Duke Street, Chelmsford.

HORNSEA.—Oct. 30.—For erection of a ladies' lavatory and cloak-room. Mr. W. E. Warburton, C.E., surveyor, Public Rooms, Hornsea, Yorks.

HORTON-IN-RIBBLESDALE.—Nov. 2.—For various trades (whole or separate) in connection with alterations to Horton-in-Ribblesdale school, Yorks. Mr. Spencer E. Barrow, architect, Liverpool Bank Chambers, Lancaster.

HUTTON.—Nov. 13.—For supplying and erecting iron buildings at schools at Hutton, near Shenfield, Essex. Mr. G. Herbert Lough, clerk, 45 Upper North Street, Poplar, E.

IRELAND.—Nov. 8.—For the supply and erection of low-pressure hot-water heating plants in connection with the heating of divisions Nos. 1, 2, 3, 4, 5, 6, 7 and 8 of the Ballinasloe district lunatic asylum. Deposit 1*l* 1*s*. Mr. G. B. Meenan, consulting engineer, 5 Charleville Road, Rathmines, Dublin.

LAMBOURN.—Nov. 2.—For brickwork abutments for a new bridge on the Lambourn and Childrey Road; also for supplying and fixing the steel troughing and handrailing. Deposit 1*l* 1*s*. Mr. J. Fred. Hawkins, county surveyor, Bank Chambers, Cross Street, Reading.

LEEDS.—Nov. 4.—For extension of Tower works, for Messrs. Harding, Richardson, Rhodes & Co. Mr. W. Bakewell, F.R.I.B.A., architect, Leeds.

LEISTON.—Oct. 26.—For erection of a higher elementary Council school and cookery, laundry and manual instruction special subjects centres at Leiston, East Suffolk. Deposit 2*l*. The Education Committee, County Hall, Ipswich.

LONDON.—For erection of large brick tower. Only those who have done similar work need apply. Franco-British Exhibition, 56 Victoria Street, London, S.W.

LONDON.—Oct. 29.—The London County Council invite tenders for new elementary school for 1,116 children at Wandsworth. Terms and conditions and official forms on application to the Architect, Education Offices, Victoria Embankment, London, W.C.

LONDON.—Oct. 30.—For erection of a post office at Blackheath. Deposit 1*l* 1*s*. Mr. J. Wager, H.M. Office of Works, Westminster, S.W.

LONDON.—Nov. 7.—For erection of iron buildings at the workhouse, Swaffield Road, Wandsworth, S.W. Deposit 1*l*. The Guardians' Offices, St. John's Hill, Wandsworth.

WOODHALL SPA.—Oct. 28.—For construction of works near Woodhall Spa, Lincs, comprising a new engine-house, 24 feet by 18 feet inside, concrete intake and tank, about 3,500 lineal yards of cast-iron pipes, 6 inches in diameter, from the new engine-house to the existing reservoir, together with machinery foundations, pump well and other works connected therewith. Deposit 2*l.* 2*s.* Messrs. James Mansergh & Sons, engineers, 5 Victoria Street, Westminster.

WORKINGTON.—Nov. 1.—For erection of pavilion for Workington Golf Club. Messrs. W. G. Scott & Co., architects and surveyors, 2 Park Lane, Workington.

PROVOST WEMYSS has repeated his offer of the same area of ground and a new house to each feuar on the Links, Buckhaven, N.B., on condition that they give up their present feus. The Links houses and gardens occupy about ten acres and have fully 100 houses, all occupied by miners, and are mostly from twenty to twenty-five years old. The ground is needed by the Wemyss Coal Company in connection with the opening up of Denbeath pit, hence the offer of new houses for old which has come in the way of the feuars.

--------------------------	--------	---	---

IMPROVED CONTINENTAL SERVICE.—The first turbine steamer intended for the Great Eastern Railway Company's Harwich-Hook of Holland service was launched at Messrs. Brown & Co.'s (builders of the *Lusitania*) yard, Clydebank, Scotland, on Tuesday, October 22. The christening ceremony was performed by Miss Hamilton, daughter of Lord Claud Hamilton, the chairman of the Great Eastern Railway Company, who named the vessel *Copenhagen*. She will have a speed of twenty knots per hour, is 343 feet long and 43 feet broad, and will have accommodation for over 300 first-class passengers. The *Copenhagen* will have all the modern improvements in respect to lighting, heating and ventilation, and special accommodation for ladies. The greater part of her cabins contain two berths only.

## TRADE NOTES.

STUDENTS of ancient stained glass may be glad to know that Mr. Thomas Curtis, 67 Frith Street, Soho Square, has in his studios some fine late fifteenth-century work from Nettlestead Church, Kent. Mr. Curtis, who has been entrusted with the restoration of this glass, will be pleased to show and explain it to visitors on presentation of their cards.

MESSRS. D. G. SOMERVILLE & Co. have secured the contract for the supply and construction of a steel-frame building with reinforced concrete floors and roofs, for Messrs. Carwarden & Co., Kingsland Road, N.

## NEW CATALOGUE.

THE approach of November fills the minds of a great many people in London and some of our provincial towns with apprehensions of the inconvenience they must suffer during the dark days of winter. The time is therefore opportune for the appearance of the catalogue of the Patent Prismatic Rolled Glass, which is made by Messrs. Pilkington Bros., Ltd., of St. Helens. It is obtainable in many sizes. The title suggests the character of the material, and those who have used it testify to the increased light which is obtained. The large Texas Mill at Ashton-under-Lyne is one of the buildings in which it is introduced and the photographs are evidence that the light is evenly distributed throughout the long rooms. Space that might be of little utility can, when the windows are glazed with the Prismatic Glass, become well adapted for working.

THE London and Lancashire Fire Insurance Company have issued the fifteenth edition of their "American Cotton Crop Movements," containing statistics that must be invaluable to traders in Lancashire.

THE Secretary for Scotland has authorised the Glasgow Corporation electricity department to borrow 150,000*l.* for the execution of works, raising the total sum authorised to be borrowed to 1,850,000*l.*

# CABOT'S INSULATING AND SOUND-DEADENING QUILT

PREVENTS THE TRANSMISSION OF SOUND through walls and floors by absorbing and breaking up the sound waves. No other Deafener does this.

KEEPS OUT HEAT OR COLD exactly as do the feathers of a bird; providing innumerable minute dead-air spaces, giving highest insulating power. Will save enough fuel in a single Winter to pay for itself. Keeps a room warm in Winter, cool in Summer. DECAY, MOTH, AND VERMIN PROOF, AND UNINFLAMMABLE.

Scientific investigation has proved that for HEAT INSULATION or SOUND-DEADENING the highest degree of efficiency, with economy in cost and extreme durability, has been attained by CABOT'S QUILT

Kinnear Patent Steel Rolling Shutters.  
Patent Interlocking Rubber Tiling.  
B. & S. Patent Folding Gates.  
Hand Power Lifts.  
Kinnear Patent Pressed Radiators.  
Burt Patent Ventilators.  
Crescent Patent Expansion Bolts.

## VARIETIES.

MR. CARNEGIE has intimated his intention to make a gift of 15,000*l.* for a new central library for the borough of Fulham.

It has been decided to enlarge the Trafalgar Institute at Portsmouth at a cost of 2,500*l.*, and the work will be put in hand at an early date.

THE Kent education committee have promised a donation of 2,000*l.* towards the enlargement of Harvey grammar school at Folkestone.

ROADWAYS are being cut through the Talbot woods on the north side of the railway line. Extensive building operations are about to be carried out in this, one of the most beautiful parts of Bournemouth.

At the last meeting of the Islington Borough Council it was reported that there was a continued increase in the number of empty properties in the borough, which in the last quarter resulted in a loss of 9,587*l.* in respect of 2,484 properties, equivalent to exactly 5 per cent. of the rate.

THE additions to the United Methodist Free Church, Field Road, Forest Gate, were opened on October 17. The contract has been carried out by Messrs. Battley, Sons & Holness, 21 Old Kent Road, the amount being 1,135*l.* 1*s.* 8*d.* The architects are Messrs. Geo. Baines & Son.

THE tender submitted by Mr. F. P. Duthoit, amounting to 2,469*l.* 19*s.* 5*d.*, has been conditionally accepted for Shortlands Congregational mission hall. The buildings are to be faced externally with red bricks and have terracotta dressings. Twelve classrooms are arranged around the main hall, opening into same by means of swivel partitions. The architects whose plans were selected in competition are Messrs. Geo. Baines & Son, 5 Clement's Inn, Strand, W.C.

ON Monday night the Southend Town Council at a special meeting were advised by the sewerage committee to adopt the new scheme designed by Mr. Elford, the borough engineer, the cost of which will be about 150,000*l.* Twenty acres of land are to be purchased for the purpose of the necessary pumping-station and tanks, and it is proposed to erect a dust destructor on the same site.

A RETURN just made to the Lambeth Borough Council discloses a remarkable state of affairs with reference to empty property in that borough. Seven years ago there were 1,137 empty houses. Last year the number had increased to 2,173. This year, however, there are as many as 2,863, the rateable value of which is 88,566*l.*, representing a loss of 4½*d.* in the pound in rates. A thousand of the empty houses are below 20*l.* rateable value.

A SUB-COMMITTEE of the Lord Provost's committee of Edinburgh Town Council have decided to instruct the city architect to prepare, in view of the removal of the slaughter-houses, a feuing plan of the ground at Fountainbridge, at present occupied by the slaughter-houses. The purpose is to show what new streets can be formed, and what the means of access to them will be, together with the cost and other matters.

Two new mills are to be erected at Castleton. It is proposed to build a ring spinning mill near the Crest Mill, and the promoters are the directors of the Cromer Spinning Company, Middleton. The other mill is to be erected by the Ensor Waste Spinning Company, Ltd., and the capital of the company is 50,000*l.*, divided into 10,000 shares of 5*l.* each. The mill will hold 19,000 cotton waste spindles. Building will be commenced immediately.

THE Agent-General for Queensland, Sir Horace Tozer, has received some samples of hardwood from a landed proprietor in his colony which the sender calls "teak." These are on view at the Queensland City office, 73 Basinghall Street. One of the samples was cut from a log which has been in use for thirty years as part of a footbridge, and its appearance shows that the timber is immune from the attack of white ants and other insect borers.

MR. W. H. EDWARDS, proprietor of the Duffryn Steel and Tinplate Works, Morriston, has invited tenders for the erection of new works for galvanising sheets at Swansea.

Customers' . . .  
Requirements . . .

W. & T. AVERY, Ltd., Soho Foundry, BIRMINGHAM.

The site selected is the old Morrision football ground adjoining the present works, and the project involves an expenditure of something like 100,000/. Employment will be found for 300 hands.

THE Ascot authorities are making extensive additions to the present line of stands and enclosures so as to afford accommodation for some 20,000 more people. A large number of men will be employed, but the new buildings will hardly be ready by June next. A new 5s. enclosure will be made, with luncheon-rooms, post-office, &c., at back.

THE engineer's report of progress at Peterhead harbour of refuge for the year ended March 31 last states that during the year the breakwater was extended 180 lineal feet of widened section. The rubble mound has been extended, widened and mostly levelled up for a length of 620 feet ahead of the foundation course. In the work yard blocks containing 19,469 cubic yards of concrete and 32,193 cubic feet of ashlar were made. The output of good stone from the quarries reached a total of 72,800 tons. The daily average number employed were:—Freemen, 238; convicts, 173; warders and guards, 260.

PLANS prepared by Messrs. H. & D. Barclay, architects, Glasgow, for a school of textile industries, have been passed by the Dunfermline Dean of Guild Court. The school is to be erected by the Carnegie Dunfermline Trust, on a site on the west side of the New Row, adjoining the Lauder technical school. It is expected that the cost will be about 11,000/., and towards this amount the Scottish Education Department have, through the School Board, already contributed 5,500/.

THE Poplar Guardians have adopted the following clause for all future contracts:—"The contractor does hereby covenant and declare that he will pay the trade union rate of wages and observe the hours of labour and conditions recognised by the trade unions in the place or places where the contract is executed, and will pay to the Guardians 1/ per day for each day during which each or any employé has not been paid the rate of wages or observed the hours of labour and conditions as recognised by the said trade unions; and the contractor further agrees to accept the recognised union in the trade affected as the sole arbitrator in any question arising under this clause, and that in case of nonpayment upon demand of any sum

forfeited under this condition, the same may either be recovered by the Guardians summarily or deducted by them from the contract price at their option."

CONSUL JOHNSON, of Liège, says:—"Little is generally known regarding the final disposition of a large quantity of newspapers left by travellers in the railway carriages. Here in Belgium, where nothing is allowed to go to waste, they are carefully collected, and at the end of every week sent to the general dépôt at Malines to be utilised in the manufacture of pulp for making a certain quality of cardboard. The quantity of old papers collected daily in the railway carriages amounts to from 660 lbs. to 770 lbs. This represents something like 260,975 lbs. a year, and this amount would be somewhat larger were it not for the fact that many of these papers are misappropriated after collection. Of late it has been observed that the supply of old newspapers is diminishing from day to day, and the administration, jealous of its rights, has complained of the shortage to the various railway stations of the country."

THE city surveyor has submitted to the Sheffield improvement committee plans of three schemes for widening Lady's Bridge from its present width of 48 feet to 58 feet. The committee have recommended to the Council scheme B, which is a design for the projection of the footway on the east side of the present bridge upon cast-iron columns and girders at an estimated cost of 2,000/. The markets committee are to be asked to add to the street the land necessary for widening the bridge, and the tramways committee to make a contribution towards the cost of the improvement. The health committee have adopted a scheme for extending and altering Glossop Road baths, at an estimated cost of 9,845/.. The new baths to be provided are Russian baths, electric sun baths, medicated vapour baths, electric medicated baths, Vichy douche baths, sitz baths and needle baths.

At a meeting of the Westminster City Council the finance committee reported that they had received the sanction of the London County Council to the borrowing of 40,000/ to defray the cost of buying the freehold of the Grosvenor Canal and adjoining properties, for use in the removal and disposal of the house and street refuse of the city. The improvements committee reported that they had received a letter from the Paddington Borough Council with

reference to Mr. Speaight's scheme for the widening of the carriageway at the Marble Arch, saying that they thought a conference of the local authorities interested should be convened with a view to common action. The committee agreed with the suggestion, and had instructed their chairman and the city engineer to attend the conference if convened. The action of the committee was approved and the report was adopted.

In his annual report on building societies in the United Kingdom, the Chief Registrar of Friendly Societies states that thirty-one new societies, of which seventeen were terminating and fourteen permanent, were established during 1906, being an increase of six over the previous year. The number of members returned for 1905 also shows an increase. Advances upon mortgage show a diminution as compared with the previous year both in the number of societies making advances and in the amount advanced, the latter having decreased from 8,922,676*l.* to 8,654,598*l.* The aggregate amount secured by mortgage shows continued progress, and now exceeds 51,000,000*l.* sterling in the United Kingdom, or nearly 94 per cent. of the total assets of the societies. The amount of large mortgages—i.e. those of 5,000*l.* and over—remains practically stationary at 2,000,000*l.*, while it is satisfactory to note that properties in possession have reached a lower percentage than at any other period during the ten years the Act of 1894 has been in full operation.

At a meeting of the Withington special committee of the Manchester Corporation a question between the employes of the works sub-committee in the pavement making department at the refuse destructor and the management was considered. It had been agreed to receive three representative workmen to discuss the men's requests for better conditions of labour, but only one man attended, and it is stated that he expressed himself satisfied. At present the men are understood to have the Corporation minimum wages of 25*s.* weekly, but it is contended that the same work is paid for at 30*s.* weekly in other places. Several of the men who asked for improved conditions are members of the Municipal Employes Association, and it is stated that those who were absent desired to be represented by their trade union officials. Mr. J. T. Jones, the Manchester district secretary of the municipal employes organisation,

has decided formally to ask the committee to receive a deputation of the men and their union officials. This phase of the question was not discussed, and the committee adjourned the further consideration of the matter.

THE sanitary committee of the Manchester Corporation report:—"The nuisance arising from the emission of black smoke from business premises has received attention, and during the year the five inspectors specially employed on this work have reported to the committee 174 cases where the emission has been two minutes or more in the half-hour's observation. Of these reports, 133 were referred to the justices to be dealt with, and in the remaining cases the offenders were cautioned. In consequence of complaints, special attention has been given to the serious emission of smoke from railway and road locomotives, and in several instances it was found necessary to prosecute the offenders. Of the 640 magistrates' summonses issued under the direction of the committee for non-compliance with notices, or for offences under the various Acts which they have to administer, the justices convicted in 256 cases, the penalties imposed amounting to 435*l.* 16*s.* 6*d.*, with costs 320*l.*; forty were ordered to pay costs only, seventeen orders of abatement were made, 223 were excused or withdrawn and 105 adjourned. In the cases withdrawn the requirements of the committee were carried out previous to the hearing."

THE medical officer of health for Glasgow (Dr. A. K. Chalmers) in his report for the year 1906 pays special reference to the existence of insanitary areas. Experience of displacements here and elsewhere has brought, he says, both gratification and disappointment. The area has been regenerated, but the displaced population has simply been dispersed. It is easy to appreciate the disappointment so frequently expressed with the results of this displacement on the character of the displaced population. It is more difficult to command the patience necessary to await the results of an educative process, and this is essentially the change which displacement from insanitary surroundings is fitted to begin. The economic aspect of the question also is not without difficulty. Between the frankly uninhabitable house which has only a stone and lime value and the insanitary area which may have individual houses, objectionable chiefly because of their situation and surroundings, there is a wide interval which existing legal

machinery does not seem able to bridge, except at a cost which may well appear to be prohibitory. But the need for action is none the less urgent. Many tenements, especially toward the circumference of the area, are fairly substantial in structure, but the internal arrangements are bad. Dark internal lobbies exist. The area cannot be satisfactorily dealt with until certain portions are removed and the space appropriated to washing-houses and other offices required by a resident population. The conversion of the remainder of the space to a playground for children would seem, with the offices already indicated, to amply occupy the ground.

### ELECTRIC NOTES.

THE Stretford District Council have approved a resolution that "the application before the Local Government Board to borrow a sum of 53,460*l.* for electricity purposes be amended," and that in lieu an application be made to the Board "to borrow a sum of 36,445*l.*" to meet the detailed expenditure on the extension of the electricity station and supply under the Council. Application will also be made "to borrow 2,723*l.* 8*s.* 3*d.*, being the expenditure incurred on the electricity undertaking in excess of the amount of 54,200*l.* sanctioned by the Local Government Board on June 7, 1902," and also for the Board's sanction to a loan of 3,000*l.* to defray the cost of purchasing motors for hire.

It has been discovered that the new heating installation for Westgreen asylum, N.B., cannot be carried out as originally intended. Reporting on the subject, the architect states that the 4-inch main supply pipes have been found inadequate for the work, and that no proper circulation can be got out of them. Two proposals are put forward to obviate the difficulty, viz. the adoption of mechanical circulation by means of two pumps or the introduction of a 5-inch flow pipe to be carried up and along the attic, and which could be levelled so as to give a perfect and natural circulation to the whole system, while the present 4-inch pipes would be suitable for returns to the calorifiers. The latter scheme, which would cost 108*l.*, as against 100*l.* for the other, is recommended.

THE York City Council have approved of a report by the tramways committee which recommended that certain

routes in the city be constructed under a Light Railways Order, and that before exercising the powers a poll of the citizens be taken to determine whether the Corporation should construct and work the tramways themselves, or lease the undertaking to a company. As regards the cost, they estimated the cost of laying down an overhead system, including the extension and adaptation of the existing carsheds, the provision of twenty tram cars and the necessary street improvements, including the strengthening of Lendal bridge, at a total sum of 110,917*l.*; and (2) for laying down the tramways by a surface contact system, including similar works and cars, at the sum of 119,959*l.*, with rails of 100 lbs. per lineal yard.

### BANGOUR ASYLUM.

At a meeting of the Edinburgh District Lunacy Board on Monday, the minutes of the works sub-committee on final accounts in connection with Bangour showed that on the 26th of last month the clerk had submitted a statement of accounts rendered by Mr. Blanc, the architect, showing that the total amount of accepted estimates was 225,187*l.* 17*s.* 5*d.* or thereby, which included measurers' fees, cost of schedules, and clerks of works' salaries, as well as a sum of 20,637*l.* 8*s.* 10*d.* for wood and iron buildings and laundry machinery. Deducting the actual expenditure of the Board (17,404*l.*) on the wood and iron buildings and verandahs from the accepted estimates, &c., Mr. Blanc's total per his statement would be 207,783*l.* 11*s.* 5*d.* The commission on that sum at 5 per cent. was 10,389*l.* 3*s.* 6*d.* To account of commission due to him Mr. Blanc had received 8,578*l.* The clerk also submitted a memorandum which he had prepared in connection with the architect's accounts, in which he found that the total contracts accepted amounted to 202,002*l.* 4*s.* 11*d.*, and that the total expenditure up to July 31 last was 191,306*l.* 1*s.* 6*d.*, these figures being exclusive of the cost of the wood and iron buildings. The commission at 5 per cent. on the amount of the accepted contracts would be about 10,000*l.* or thereby. The total paid to Mr. Blanc by the Board up to that date was 11,748*l.* 18*s.* 5*d.*, but of that sum 3,170*l.* 1*s.* 5*d.* was for miscellaneous services, discarded plans and general outlays and expenses, which had already been adjusted and passed by

the Board. Deducting that sum from the amount paid to Mr. Blanc left a balance of 8,578*l.* 17*s.* as the actual payment made to him as commission on the whole works executed. Mr. Blanc stated that his outlays for special visits and for copies of plans, &c., since the date of last settlement with him had been 263*l.* 13*s.* 11*d.*, so that there was apparently due to him at this date the sum of 8,641*l.* 16*s.* 11*d.* The clerk reported that it would be necessary at a future date for him to go over and adjust with Mr. Blanc the figures upon which their respective statements were based, and in the meantime he recommended that a further payment of 1,200*l.* be made to the architect on account of the fees due to him by the Board. That recommendation was agreed to by the sub-committee.

At a subsequent meeting of the works committee it was agreed to recommend to the Board that it be remitted to Messrs. Gibson, Huie and Cumming, as a committee, to have an interview with Mr. Blanc regarding the adjustment of his accounts against the Board.

### FERRO-CONCRETE CONSTRUCTION.

A LECTURE was given by Professor Henry Adams, M.Inst.C.E., &c., on the 10th inst. on the above subject at the Engineering Exhibition, Olympia, under the chairmanship of Mr. J. D. Searles-Wood. He first described the principle of the construction, in which steel, strong in tension, was used in such a way that it took up all the tensile stress, and cement concrete, which was strong in compression, took up all the compressive stress, the combination giving an efficient and economical result. The principles of stress were explained by means of an indiarubber beam differently marked on the four sides and permitting of simple manipulation. The different forms of steel reinforcing bars and their strength were noted. The best protection from corrosion was stated to be Portland cement wash after slight rusting had removed the mill scale. The composition of the concrete and mode of mixing and placing were dealt with, and reference made to the engineering standard specification for cement. The general type of a ferro-concrete building was described from foundations to roof. The building by-laws of London unnecessarily hamper the use of

ferro-concrete, and it is hoped that the modifications which are now under consideration will permit of its use in a reasonable manner. The Local Government Board also raise a bar to progress by limiting their loans on ferro-concrete works to fifteen years only instead of thirty years, as is the case with structures of brick or stone. The lecturer illustrated by lantern photographs many varieties of buildings in ferro-concrete, both exteriors and interiors; then the details of construction came under review, the early failures through want of provision for shear strength being shown in a very graphic manner. A series of slides illustrating the failure of the third Madrid reservoir were shown, and many illustrations showing the various modes of constructing foundations brought the Professor's interesting lecture to a close.

### DECAY OF STONE IN GLASGOW.

THE decay of the stonework in many Glasgow buildings has attracted much attention recently. Several of the newer buildings appear to have resisted atmospheric and other influences tolerably well, in others decay has set in within a few years of erection, and in one or two instances before completion. Preservative measures are numerous and frequently costly, but their application does not always seem to be attended with success. Among the buildings which have shown some signs of decomposition is that of the Glasgow Stock Exchange in Buchanan Street. The older portion was not only very much discoloured, says the *Glasgow Herald*, but in a rather serious state of decay, and it was found necessary to renew a good deal of the carved work and to re-chisel many of the stones in front. The treatment applied to the building was the "Farnham process." By this process the pores of the stone were effectively impregnated with paraffin wax, which is said to prevent the inroads of the atmospheric acids which cause disintegration. The paraffin was forced into the stone at a high temperature, the pores being hermetically sealed and filled with wax to a depth of about half an inch. The whole building was thoroughly waterproofed and afterwards sand-blasted. Sand-blasting was applied a second time to remove any surplus wax and clean any slight discoloration that might have been caused by the stoves used for heating the

stone. A portion of the Buchanan Street part of the building still requires some treatment, but the entire work will be completed in a few weeks. Apart from the intrinsic value of the process, it may be said that the appearance of the building has been vastly improved. One very noticeable feature of the process is that it preserves intact or restores the original tone colour of the stone.

#### A MAGNETIC OBSERVATORY.

THE magnetic observatory which is being erected for the Government at Eskdalemuir will be completed in a few weeks' time. It was begun last year in the month of March, and the estimated cost is about 20,000*l.* The buildings are situated on part of the farm of Nether Cassock, ten acres of which were acquired for the purpose from the Duke of Buccleuch. The observatory stands a little off the main road which runs between Langholm and Edinburgh, by way of Innerleithen—fifty-six miles distant from the city. It is equi-distant seventeen miles from Lockerbie and Langholm, and twenty-eight miles intervene between it and Hawick. Approached from the road which has been made off the main thoroughfare, the first set of buildings at the south end consists of the caretaker's and junior assistant's dwelling-house. The next buildings consist of the workshop and office block, in which there are a library and laboratory thoroughly equipped. To the left is a large room for photographic purposes, with the necessary dark chamber, &c., while to the north is the seismograph-room, where the earth's disturbances will be recorded, the principal pier in this room having been sunk 20 feet down to the solid rock. There are also packing and other rooms, while in the basement are the heating apparatus and gas generating chamber. Near the south-west corner of the ground is the senior assistant's house. In the centre of the grounds stands the magnetograph house, which is underground. The sinking for this necessitated an average cutting of 13 feet, the biggest cutting being 18 feet, and the whole of the material taken out was banked over the building, which at this point is 800 feet above the Ordnance datum. Further north, towards the northern boundary of the ground, are situated two magnetic huts, placed, like the magnetograph house, to the

magnetic north. There are also offices and stables, and the whole of the buildings are enclosed by a wall. The buildings are built of whinstone with freestone facings.

#### DIRECT LABOUR *v.* CONTRACT.

THE following letter from the Norwich builders respecting the Hellesdon Asylum extension has been addressed to the members of the Town Council:—

Mr. Mayor and Gentlemen,—At the last meeting of Council a report was presented stating the cost of the above works as carried out by direct labour, and also a comparative statement showing what the cost would have been if carried out by a contractor. The committee of our Association, having had their attention called to these reports have looked into the matter, so far as information in their possession has enabled them to do, and I am desirous by them to call the attention of the Council to some apparent errors and discrepancies in such reports. Various preliminary and provisional items, which were included in the original bill of quantities (of which some members of my Association hold copies), do not seem to have been dealt with, for instance:—(1) The contractor was asked to insure the buildings against fire; (2) to insure all workmen under the Employers' Liability Acts and Workmen's Compensation Acts, 1897, &c.; (3) to provide water for the carrying out of the works; and (4) to provide for maintenance of works for six months after completion. A reasonable amount to allow for these four items would be 75*l.* (5) It would appear from the debate in the Council that no establishment charges have been included in the report. These at the rate of 5 per cent. work out on the actual reported cost (11,608*l.*) at 580*l.* 8*s.* (6) It has been noticed that a new gable wall is charged as an extra. The cost of removing the old gable bodily or building a new wall in place thereof was included in the original tender and cannot be an extra 125*l.* (7) There was also a item provided in the tender for "contingencies" (100*l.*) This ought certainly to have been credited off the claim for extra works at 100*l.* (8) The report states that the tender of 8,211*l.* did not include the heating of the buildings. My committee maintain that 400*l.* of this sum was expressly included in the bill of quantities; the amount being litho-

WORK IN BRASS FOUNDRIES.

THE following order by the Home Secretary is to be observed from Friday next :—

In pursuance of section 116 of the Factory and Workshop Act, 1901, I hereby make the following order :—

The provisions of the said section shall apply, subject to the modifications hereinafter contained, to factories and workshops in which the undermentioned processes or any of them are carried on, and to outworkers employed in those processes and the occupiers or contractors by whom they are employed :—The mixing, casting and manufacture of brass and of any articles or parts of articles of brass and the electro depositing of brass (including in the term brass any alloy or compound of copper with zinc or tin), except when carried on as a subsidiary process in shipbuilding yards or in marine, locomotive or other engine-building works, or in general engineering or in machine-tool works.

The said section shall be modified so as to read as follows :—

1. The occupier or contractor shall for the purpose of enabling each worker who is paid by the piece to compute the total amount of wages payable to him in respect of his work, cause to be published particulars of the rate of wages applicable to the work to be done, and also particulars of the work to which that rate is to be applied, as follows :—

(a) He shall furnish every worker with particulars of the rate of wages applicable to the work done by him, either (1) by handing him such particulars, in writing, when the work is given out to him; or (2) by supplying him with such particulars in writing at the time of his employment, and on every subsequent occasion when the rates are fixed or altered; or (3) in the case of persons employed in a factory or workshop, by exhibiting such particulars in the factory or workshop on a placard containing no other matter than the rates of wages applicable to the work done in the factory or workshop, and posted in a position where it is easily legible by the workers. Provided that if in any case the work given out is of a novel kind for which no rate of wages has been fixed, and if the employer and workman for the purpose of arriving at a rate for the work so agree, it shall not be necessary for particulars of the rate of wages to be furnished when the work is given out, provided such

graphed and carried through in the total column clearly shows this to be so, and from which item all builder's work in connection therewith was excluded (see item 21)—400l. (9) The foundation trenches were not required to be dug to the depth originally "taken;" this, with the consequent saving in concrete and brickwork, should represent a saving of at least 150l. (10) It has come to the knowledge of my committee that shutters for the epileptic wards were not supplied in their entirety. There should thus be a saving, say, about, on these items of 50l. (11) With regard to the items of omission mentioned in the report (384l. 6s.) for fire escape, store, &c., and another item of 334l. clerical error, making a total of 718l. 6s. omitted. The contractor would have been bound by his contract to carry out and complete these works without any extra cost, seeing that the error in calculation was his. This amount, therefore, cannot come into any comparative statement as an extra 718l. 6s. Total, 2,198l. 14s. With regard to the comparative report of ascertained cost on the basis of another tender from a Norwich builder selected by the asylum committee, it is clearly shown that 1,200l. extra is charged for heating, whereas in the former report only 800l. extra is charged, so that there is a clear discrepancy of 400l. between the two statements. Both statements cannot be correct, and in either case a credit of 400l. is included in the original estimates. You will observe that even with the limited knowledge of the subject in the possession of my committee they have been enabled to point out discrepancies of over 2,000l. in the report, and therefore feel justified in asking that these works be properly surveyed and the accounts audited, so that the true position may be placed before you so as to enable you to arrive at a sound decision in this matter, which so directly affects the ratepayers and the building trades of the city.

Accompanying the above letter is a comparative statement of account which purports to show :—

	£	s.	d.
Total cost of works as carried out by direct labour (see report)	11,608	0	0
Total cost if the highest tender (9,547l.) had been accepted	10,024	12	0
Thus saving to the ratepayers	1,583	8	0

particulars are furnished to the worker when the work is completed.

(b) Such particulars of the work given out to be done by each worker as affect the amount of wages payable to him shall be furnished to him in writing at the time when the work is given out to him.

(c) The particulars, either as to rate of wages or as to work, shall not be expressed by means of symbols; but this shall not prevent the occupier or contractor from describing any work which is of a standard kind known to the persons employed by a particular number, letter or name by means of such number, letter or name.

2. If the occupier or contractor fails to comply with the requirements of this section he shall be liable for each offence to a fine of not more than 10*l.*, and in the case of a second or subsequent conviction within two years from the last conviction for that offence, not less than 1*l.*

3. If anyone engaged as a worker in any of the aforesaid classes of work having received such particulars, whether they are furnished directly to him or to a fellow workman, discloses the particulars for the purpose of divulging a trade secret, he shall be liable to a fine not exceeding 10*l.*

4. If anyone for the purpose of obtaining knowledge of, or divulging, a trade secret, solicits or procures a person so engaged to disclose such particulars, or with that object pays or rewards any such person, or causes any person to be paid or rewarded for so disclosing such particulars, he shall be liable to a fine not exceeding 10*l.*

In this order the term "outworker" means any person employed in the business of a factory or workshop outside the factory or workshop, whether directly by the occupier thereof or by any contractor employed by him, and also any person employed by the occupier of any place from which work is given out, or by a contractor employed by him. This order shall come into force on Nov. 1, 1907.

#### A REINFORCED CONCRETE CODE.

THE Concrete Association of America recently submitted to the Building Code Revision Commission of New York City the following regulations for adoption:—

1. Reinforced concrete construction shall be understood

to mean an approved concrete mixture reinforced by steel of any shape, the two materials to be so combined that the concrete will take up the compression stresses and the steel the tension stresses and assist the concrete in shear and compression.

2. Reinforced concrete construction when designed in accordance with this code shall be approved for fireproof construction.

3. Before permission to erect any reinforced concrete structure shall be granted complete drawings and specifications must be filed by the architect or engineer representing the owner with the superintendent of buildings, showing all construction details, including dimensions of concrete and the sizes and position of all reinforcing members.

4. The concrete shall be mixed in the proportions of not less than one part of cement by volume to seven parts of aggregates by volume, consisting of sand and broken stone or gravel. The proportion shall be such that the resistance of the concrete to crushing shall not be less than 2,000 lbs. per square inch after hardening for twenty-eight days. Tests to determine this value shall be made from time to time by a competent engineer under the direction of the Bureau of Buildings. The concrete used in reinforced concrete construction shall be what is usually known as a "wet" mixture.

5. All cement used in reinforced concrete construction shall be a Portland cement conforming to the standard specifications of the American Society for Testing Materials and shall be tested by an independent chemist not in the employ of the cement manufacturer. Records of these tests shall be kept on file in the contractor's office.

6. All sand used in reinforced concrete construction shall be clean and sharp, free from loam, dirt or other injurious material, and shall not be finer than the standard sample in the office of the Bureau of Buildings.

7. All stone used in reinforced concrete construction shall be clean, broken trap rock or gravel, and shall not be of a size larger than can be easily worked or tamped around the reinforcing members. In case it should be desired to use any other material or kind of stone than specified above, samples of same shall first be submitted to and have the approval of the Superintendent of Buildings.

8. Steel for reinforced concrete construction shall have

an elastic limit of at least 30,000 lbs. per square inch, and an ultimate strength of at least 60,000 lbs. per square inch, and shall be of uniform quality. Samples cut from any bar shall be capable of bending cold 180 degs. around a bar of equal diameter without signs of fracture.

If twisted, corrugated, diamond or other mechanical bond bars are used, such bars may be stressed in tension to 16,000 lbs. per square inch, or to one-third of their elastic limit; in shear to 10,000 lbs. per square inch, and in compression to twelve times the compression stress in concrete.

9. All steel reinforcement shall be completely encased in the concrete, and in beams, girders, columns and walls the steel shall not be nearer the surface than  $1\frac{1}{2}$  inch. In floor and roof slabs the steel shall not be nearer the surface than  $\frac{3}{4}$  inch for bars having a diameter of  $\frac{1}{2}$  inch or less. Where larger bars are used in floor or roof slabs, the steel shall not be nearer the surface than 1 inch.

Where the number of bars used in a beam or girder cannot be placed in one plane they shall be placed in two or more planes.

In reinforced concrete footings the steel shall not be nearer the surface than 3 inches.

10. Reinforced concrete shall be so designed that the stresses in the concrete and steel shall not exceed the following limits:—

	Pound per Square Inch.
Extreme fibre stress on concrete in compression . . . . .	600
Shearing stress in concrete . . . . .	100
Concrete in direct compression . . . . .	500
Tensile stress in steel . . . . .	16,000
Shearing stress in steel . . . . .	10,000
Compressive stress in steel twelve times the compressive stress in the concrete.	

11. The adhesion of concrete to steel shall be assumed to be not greater than the shearing strength of the concrete.

12. The ratio of the moduli of elasticity of concrete and steel shall be taken as 1 to 12.

13. The following assumption shall guide in the determination of the bending moments due to the external forces. Beams and girders and floor slabs may be considered as

continuous where proper provision for continuity is made in the design, the bending moment for uniformly distributed loads being taken at not less than  $WL/10$ . In the case of square floor plates which are reinforced in both directions and supported on all sides the bending moment may be taken at  $WL/20$ .

In figuring T beams the width of the floor slab to be considered as part of the beam or girder shall be determined by the shearing resistance of the slab along the beam, but in no case shall the width of the floor slab so considered exceed the distance between beams, and provided also that the beam or girder and slab shall be built at the same time as a unit.

14. The amount of resistance of reinforced concrete construction in transverse loads shall be determined by formulae based on the following assumptions:—

(a) The bond between the concrete and steel is sufficient to make the two materials act together as a homogeneous solid.

(b) The strain in any fibre is directly proportionate to the distance of that fibre from the neutral axis.

(c) The modulus of elasticity of the concrete remains constant within the limits of the working stresses fixed in these regulations.

From these assumptions it follows that the stress in any fibre is directly proportionate to the distance of that fibre from the neutral axis.

The tensile strength of the concrete shall not be considered.

15. When the shearing stresses developed in any structural member of reinforced concrete construction shall exceed the safe working strength of the concrete, as fixed in these regulations, a sufficient amount of steel shall be introduced in such positions that the deficiency in the resistance to shear shall be provided for.

16. When the safe limit of adhesion between the concrete and steel is exceeded, some provision must be made for transmitting stresses from the concrete to the steel.

17. Reinforced concrete may be used for columns and their strength determined as follows:—

The concrete within the steel ties or hoops may be stressed in compression to 500 lbs. per square inch. No allowance shall be made for the concrete outside of the

**For Index of Advertisers, see page x.**

hoops or ties and serving the purpose of fireproofing. Vertical steel bars may be placed in the concrete, and if substantially tied together by steel bars at intervals of not more than the least side or diameter of the column, may be stressed in compression to twelve times the compressive stress in the concrete. These rods shall be joined immediately above the floor line or at points of lateral support. They shall have full perfect bearings and be connected by tight-fitting sleeves or the ends may be threaded and connected by standard sleeve nuts.

In concrete columns with vertical reinforcement the total cross section of vertical steel shall not be less than  $\frac{1}{2}$  of 1 per cent. of the cross section of the concrete within the hoops or ties, but in no case shall this amount be less than 1 square inch.

Concrete columns reinforced by spirally wound hoops of steel shall be designed in accordance with the following formula:—

$$P = [1.5fc + (3fs' \times As') \div r] Ac + fs' As'$$

Where  $P$  = working loads in pounds.

$fc$  = 500 lbs.

$fs'$  = 20,000 lbs. for cold drawn wire.

$fs$  = 6,000 lbs. on vertical steel.

$Ac$  = area concrete inside of hoops.

$As$  = area of vertical steel.

$As'$  = area of spirals per unit of column length.

$r$  = radius of spirals in inches.

Minimum amount of spiral steel shall be such that  $(fs' \times As') \div r$  shall not be less than 75 lbs.

For columns with greater length than twelve times the least diameter the value of  $fc$  to be used in the above formula shall be reduced.

The hoops shall not be spaced closer together than  $1\frac{1}{2}$  inch, nor further apart than one-seventh of the diameter of the spiral. In no case shall the total cross section of vertical steel be less than 1 per cent. of the cross section of the concrete within the spiral.

Additional reinforcement or reduction in the compressive stress on the concrete shall be made for columns eccentrically loaded.

18. Spandrel walls supported entirely on reinforced concrete wall girders and extending from the floor-line to the window-sill shall have a minimum thickness of 8 inches

and shall be reinforced with not less than  $\frac{1}{2}$  lb. of steel per square foot of wall.

Enclosure walls of skeleton buildings built in between columns and supported entirely on reinforced concrete girders shall have a minimum thickness of 8 inches for 40 feet of the uppermost height thereof or the nearest tie of beams to that measurement. For each additional 30 feet of height or to the nearest tier of beams to that measurement the thickness of the wall shall be increased 1 inch. Basement walls shall be at least 2 inches thicker than the walls immediately above. All such enclosure walls shall be reinforced with not less than  $\frac{1}{2}$  lb. of steel per square foot of wall. All window or door openings shall be reinforced with steel on the sides and at the top and bottom in addition to the steel specified above. Where walls are required to meet special conditions the thickness and the amount of reinforcement shall be determined by such conditions.

Parapet walls shall have a minimum thickness of 6 inches and shall be reinforced with not less than  $\frac{1}{2}$  lb. of steel per square foot of wall.

Enclosure walls for one-storey storage or factory buildings shall have a minimum thickness of 4 inches and shall be reinforced with not less than  $\frac{1}{2}$  lb. of steel per square foot of wall.

19. Partitions required by the code to be fireproof may be constructed of reinforced concrete and shall have a minimum thickness of 3 inches, and shall be reinforced with not less than  $\frac{1}{4}$ -inch rods on 12-inch centres, running both vertically and horizontally.

20. Reinforced concrete construction may be continued during freezing weather provided all frost is eliminated from the sand and broken stone by artificial heat, and provided also that the work is protected from the weather by canvas or similar means, and artificial heat supplied to prevent the concrete from freezing prior to taking its final set.

21. The contractor must be prepared to make load tests on any portion of reinforced concrete construction within reasonable time after erection. The tests must show that the construction will sustain a load of twice the live load for which the section was designed without any sign of failure.

# WARING'S

(WARING & GILLOW, LTD.)

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

TENDERS, ETC.

\*\* As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

COMPETITIONS OPEN.

HERTFORD.—Nov. 30.—The Corporation of Hertford invite designs for the erection of offices at a cost not exceeding 3,500l. Premiums of 50l. and 20l. will be awarded. Particulars can be obtained from Mr. John H. Jevons, A.M.I.C.E., borough surveyor, Hertford.

SUNDERLAND.—Nov. 5.—For erection of branch library in Vilette Road. Deposit 2l. 2s. Messrs. Davidson & Cratney, architects, 22 Fawcett Street, Sunderland.

THURLSTONE.—Nov. 25.—The Thurlstone Urban District Council invite plans for council-room, offices, caretaker's house and outbuildings (cost not to exceed 650l. for building and heating apparatus only). For instructions and particulars apply to Mr. J. Wadsworth, clerk, Thurlstone, near Penistone.

WARRINGTON.—Nov. 30.—The Directors of Warrington Garden Suburbs, Ltd., invite architects practising within a 30-mile radius of Warrington and architects having previous experience in the planning of garden suburbs to submit competitive designs for laying-out their estates at Great Sankey and Morrisbrook Farm, Grappenhall. Conditions and particulars may be obtained on deposit of 1l. 1s. Mr. A. Bennett, Secretary to the Company, Market Gate Chambers, Warrington.

CONTRACTS OPEN.

AUDENSHAW.—Nov. 12.—For rebuilding Audenshaw (Hundred) Bridge, on main road from Manchester to Ashton-under-Lyne. The work comprises the taking-down of the old arch bridge and the building of a new bridge in masonry and steel, with a span of 22 feet 9 inches and a width between parapets of about 50 feet. The County Bridgmaster's Office, Preston.

BARNET.—Nov. 9.—For construction of foundations, drains, roads, fences, water supply and other works (not including the structure) in connection with isolation hospital

to be erected in Mays Lane. Mr. H. F. Traylen; architect, 34 Great James Street, Bedford Row, London.

**BARROW-IN-FURNESS.**—Nov. 19.—For (a) construction and delivery complete of a floating bath in Ramsden Dock, and (b) erection and completion of conveniences, &c., appurtenant thereto, for the Corporation. Deposit 5*l*. The Borough Engineer's Office, Town Hall, Barrow-in-Furness.

**BELMONT.**—Nov. 6.—For erection of a cottage at Belmont, Sutton, Surrey, for the Metropolitan Asylums Board. Deposit 1*l*. Messrs. T. W. Aldwinckle & Son, architects, 20 Denman Street, London Bridge, S.E.

**BOURNEMOUTH.**—Nov. 4.—For erection of elementary schools in Middle Road. Deposit 2*l*. 2*s*. Mr. F. W. Lacey, architect to Education Committee, Municipal Office, Bournemouth.

**BRIGHTLINGSEA.**—Nov. 14.—For erection of a police station at Brightlingsea, Essex. Deposit 10*l*. Mr. F. Whitmore, county architect, Duke Street, Chelmsford.

**DORCHESTER.**—Nov. 6.—For erection of new latrines and making alterations to girls' school. Mr. J. Feacey, architect, South Walks, Dorchester.

**EARL SHILTON.**—Nov. 12.—For erection, completion and maintenance for six months after completion of new shops and stores at Earl Shilton, Leicester. Deposit 1*l*. Mr. W. T. Grewcock, architect, 8 New Street, Leicester.

**GLASGOW.**—Nov. 9.—For works required in erection of servants' block, Belvidere hospital. The Office of Public Works, City Chambers, 64 Cochrane Street.

**HARLOW.**—Nov. 14.—For erection of police station at Harlow, Essex. Deposit 10*l*. Mr. F. Whitmore, county architect, Duke Street, Chelmsford.

**HATFIELD.**—Dec. 2.—For alterations and additions at the Sawbridgeworth, Fawbert and Barnard County Council school. Deposit 2*l*. Mr. U. A. Smith, County Surveyor's Office, Hatfield.

**HORTON-IN-RIBBLESDALE.**—Nov. 2.—For various trades (whole or separate) in connection with alterations to Horton-in-Ribblesdale school, Yorks. Mr. Spencer E. Barrow, architect, Liverpool Bank Chambers, Lancaster.

**HUTTON.**—Nov. 13.—For supplying and erecting iron buildings at schools at Hutton, near Shenfield, Essex. Mr. G. Herbert Lough, clerk, 45 Upper North Street, Poplar, E.

**IRELAND.**—Nov. 8.—For the supply and erection of low-pressure hot-water heating plants in connection with the heating of divisions Nos. 1, 2, 3, 4, 5, 6, 7 and 8 of the Ballinasloe district lunatic asylum. Deposit 1*l*. 1*s*. Mr. G. B. Meenan, consulting engineer, 5 Charleville Road Rathmines, Dublin.

**LAMBOURN.**—Nov. 2.—For brickwork abutments for a new bridge on the Lambourn and Childrey Road; also for supplying and fixing the steel troughing and handrailing. Deposit 1*l*. 1*s*. Mr. J. Fred. Hawkins, county surveyor, Bank Chambers, Cross Street, Reading.

**LEEDS.**—Nov. 4.—For extension of Tower works, for Messrs. Harding, Richardson, Rhodes & Co. Mr. W. Bakewell, F.R.I.B.A., architect, Leeds.

**LEEDS.**—Nov. 7.—For bricklayer and mason, carpenter and joiner, plumber and glazier, plasterer, painter, slater and ironfounder's works required in erection of two separate blocks (blocks 1 and 2) at the workhouse, Beckett Street. Messrs. Thomas Winn & Sons, architects, 84 Albion Street, Leeds.

**LONDON.**—Nov. 12.—For tea-house and conveniences, Hyde Park. Deposit 1*l*. 1*s*. H.M. Office of Works, &c., Storey's Gate, S.W.

**LONDON.**—Nov. 12.—For erection of a tramways car-shed at Mare Street, Hackney, for the London County Council. Deposit 2*l*. 2*s*. The Highways Section of the Architect's Department, 13 Charing Cross, S.W.

**LONDON.**—Nov. 13.—For carrying-out general repairs to the relief offices, 7 Fairfield Road, Bow; also for asphaltting work at the Guardians' Offices. Mr. G. Herbert Lough, clerk, 45 Upper North Street, Poplar, E.

**LONDON.**—Nov. 19.—For erection of a county court at Westminster. Deposit 1*l*. 1*s*. Mr. H. N. Hawks, I.S.O., H.M. Office of Works, &c., Westminster, S.W.

**MARYPORT.**—Nov. 4.—For construction of a jarrah timber slipway at Maryport, Cumberland, near the Senhouse dock, for the Royal National Lifeboat Institution. Deposit 1*l*. Mr. Quintin Moore, hon. secretary, Harbour House, Mary-

WALES.—Nov. 11.—For erection of schools at Tallstown, Cwm, Ebbw Vale, together with caretaker's house, boundary walls and other works. Deposit 3*l*. 3s. Messrs. Henry Walters & Stanley Hutchins, joint architects.

WALES.—Nov. 13.—For carrying-out foundations for the proposed temporary school at Caerau, and also erection of permanent offices and playsheds, for the Glamorgan County Council. The County Offices, Westgate Street, Cardiff.

WALES.—Nov. 14.—For construction of new stabling and latrines, &c., at the County hotel, Ebbw Vale. Mr. Hy. Waters, architect, Market Chambers, Ebbw Vale.

WESTCLIFF-ON-SEA.—Nov. 14.—For erection of police quarters. Deposit 10*l*. Mr. F. Whitmore, county architect, Duke Street, Chelmsford.

WIMBLEDON.—Nov. 15.—For the erection of a pair of semi-detached houses in Durham Road, Raynes Park. Messrs. Belfrage & Savile, architects, 27 Chancery Lane, W.C.

CONSUL L. E. DUDLEY, who represents the United States in Vancouver, British Columbia, reports that at the rate at which timber licenses are now being taken it is estimated the Canadian Government will realise during the present year 750,000 dollars from new licenses and 500,000 dollars from renewals. American capitalists are leading in the acquirement of timber leases. A St. Paul, Minn., company recently purchased 261,000 square miles of timber lands, partly on Vancouver Island, the remainder upon the mainland, paying about 5,000,000 dollars for the same, and proposes building six large sawmills at once. One American is said to have realised more than 1,000,000 dollars profit upon his holdings acquired in the last few years. The provincial lands are not sold, and all logs cut upon such lands must be manufactured within the province. The lands now changing hands by sale and purchase came into private hands before the enactment of the law now in force. Each person leasing timber lands pays 150 dollars a year, and the leases may be renewed or continued for twenty-one years. When the timber is cut a royalty of 50 cents a thousand feet is payable. It is understood that the provincial Government has reserved the right to raise the license fee or to increase the amount of the royalty when it seems good policy to do so. The price of logs in this market recently fell considerably, while wages remain at the high figures reached some time ago. The lumbermen are no longer embarrassed for cars for shipping lumber and shingles to the East. Taken altogether, the condition of the lumber industry is most prosperous.

Ludgate Circus,  
London.

## TRADE NOTES.

MESSRS. D. G. SOMERVILLE & Co. have secured the contract on their design for constructing all roofs, arches and ceilings in reinforced concrete for St. Charles College Chapel, Notting Hill.

THE new chapel for the Bedford Grammar School is now nearly completed, the architect being the late G. F. Bodley, R.A. The whole of the stone employed is Monks Park, from the quarries of the Bath Stone Firms, Ltd.

A LARGE clock has just been erected in the church tower of Kimbolton, Hunts, by Messrs. John Smith & Sons, Midland Clock Works, Derby. It is fitted with all modern improvements, and is made generally to the designs of the late Lord Grimthorpe.

UNDER the direction of Messrs. W. O. & O. P. Milne, architects, 77 Chancery Lane, E.C., the "Boyle" natural system of ventilation, embracing the latest patent "air-pump" ventilators, has been applied to the West Lynn schools, Norfolk.

MESSRS. J. LONGBOTTOM & Co., of Belgrave Foundry, Leeds, have the following installations in hand or have just fixed:—Shaugh Prior Church, near Plymouth; St. Martin's-by-Looe, Cornwall; Coleby Church, Lincoln; Redruth Technical Schools, Cornwall; Hutton Cranswick Church, Beverley; Saltash Mission Hall, Plymouth; Stokenham Church, Kingsbridge, Devon; Alfriston Church, Berwick, Sussex; Riccall Church, near Selby, Yorks; St. Mark's Church, Leeds; Muker Church, Swaledale, Richmond, Yorks; and Aberford Church, near Leeds.

THE judges in the competition for the best tar-spreading machine and the best preparation of tar for road purposes have awarded the first prize for the best tar-spreading machine to Thomas Aitken, County Buildings, Cupar-Fife, for "Aitken's Pneumatic Tar Sprayer," and the second prize to Tarspra, Ltd., of 20 Victoria Street, London, S.W., for their "700-gallon Thornycroft 'Tarspra' Motor Van." The prize for the best preparation of tar for road purposes has been awarded to Messrs. R. S. Clare & Co., Ltd., of Liverpool, for their "Clare's Patent Tar Compo."

## ELECTRIC RADIATORS.

If cheapness, artistic design and efficiency are recommendations, then the electric radiators of the Dowsing Radiant Heat Co., Ltd., are sure of success. In the first place, the metal radiator is produced in a great variety of styles. It can be obtained of a square or rectangular type in wrought-iron with copper, or coppered all over, in a fan-shaped form, or in a style allied to Adam's, Chippendale or Sheraton work, or of a modern French type. It can also be procured in setting of Doulton's majolica ware. The radiators are therefore adapted for business premises, offices, dining-rooms, drawing-rooms or boudoirs. As to price, one can be obtained with two heat lamps as low as 1*l.* 17*s.* 6*d.*, and four lamps can be obtained for 2*l.* 15*s.* Handsome fan-shaped radiators in copper and brass can be purchased for 5 guineas and 6*l.* 10*s.* Some have the advantage of portability, and they can therefore be placed in different parts of a room according to circumstances. The radiators have been adopted in Buckingham Palace, Windsor Castle, the Royal Yacht, in Government offices, in municipal offices, asylums, theatres, banks. But perhaps the best testimony to their utility is derived from their purchase by various electric supply companies and electric lighting companies. They can be employed not only in interiors but out of doors, and they are quite safe in gunpowder rooms. There is no waste with them, and no smoke, dust or contamination of air.

THE Perth Town Council have had a conference with Mr. J. J. Burnet, A.R.S.A., the assessor, in connection with the new City Hall, as to the conditions under which the competition for the plans of the new hall will take place. It has been decided that the first prize plan is to secure the building of the hall, but no premium will be paid to the author. Premiums of 50*l.*, 30*l.* and 20*l.* will be awarded to the architects whose plans are placed second, third and fourth respectively. The entire square is included, and the situation of the new hall is left to the architects. Seating accommodation is to be provided for 2,000 people, so that the hall when crowded will hold considerably over that number. The plans must be lodged with the town clerk not later than February 1, 1908.

## DOULTING STONE.

A SMALL residence called "Stileman's Copse," at Munstead, near Godalming, for Mr. E. P. Arnold, has been completed from designs by Sir Chas. Nicholson, Bart., and Mr. H. C. Corlette, architects. The principal features are two canted bay windows on the south front going the whole height of the building, with the main cornice breaking round and a projecting porch on the north front. The walls are of local stone with brick backing, and the window dressings, cornice, &c., are of Doulting stone supplied from the Chelynch beds by the Ham Hill and Doulting Stone Company, Ltd. Messrs. Nicholson & Corlette are also carrying out the rebuilding of St. Martin's Church, Epsom, now in course of erection by Messrs. Benfield & Loxley, of Oxford. The cost when completed will be about 15,000*l.*, and Doulting stone supplied from their Chelynch beds by the Ham Hill and Doulting Stone Company, Ltd., is being used for the dressings, traceries, &c., with walls of rubble masonry. The church is vaulted throughout and is being built on the site of the old one.

## PRESERVATION OF WOOD.

TIMBER, like all organic substances, is liable to decay. But fortunately science has been able to find remedies. If the Egyptians were able to preserve animal substances for two or three thousand years, it seems a comparatively more simple task to act upon the fibres of timber. Messrs. C. A. Peters, Ltd., are not satisfied with simply describing their preservative which is known under the title of "Carbolineum Avenarius." They tried experiments several years ago, and they have taken the precaution to have specimens signed and sealed by officials in Germany. One

is a piece of fencing which has been preserved for twenty-five years, another for ten years, a third fourteen years and so on. In contrast with these, specimens of untreated timber are also shown. Vine posts, which were pointed, have retained their sharpness for over twenty years. All this is not magic. It is simply an application of science which acts upon the parts liable to decay, and which is also fatal to insect enemies of timber. Wood-paving blocks have likewise been subjected to the process; and among the London streets where they have been laid down are Northumberland Avenue, Whitehall, Duncannon Street, Endell Street and Harley Street. The preservative is applicable to all classes of timber required in construction, as well as sleepers, telegraph poles, signal posts, gates, fencing, bridges, piers, &c. There is a special preservative called Sotor which is adapted for timber which is liable to the destructive attacks of the sea-worm, and the prism anti-oxide is effectual against the rusting of metals.

MESSRS. HAMPTON & SONS, at the Mart, Tokenhouse Yard, on Tuesday offered for sale a newly-erected block of buildings known as Queen Anne's Chambers, situated between Victoria Street and St. James's Park. The property has frontages to Broadway, Tothill Street and Dean Farrar Street, and a superficial area of about 35,000 feet. The accommodation comprises over 570 rooms, with eight shops; the actual and estimated rentals amount to 25,000*l.* per annum, and the property is held by lease from the Ecclesiastical Commissioners for a term of 999 years from Christmas 1898, at a ground-rent of 2,687*l.* 14*s.* 10*d.* per annum. Mr. W. Roland Peck, who occupied the rostrum, suggested 150,000*l.* as a start. The first bid was 130,000*l.*, and by six advances 143,000*l.* was reached, at which a sale was declared.

At the next meeting of the Derby Town Council the special drainage committee will, it is understood, ask for a grant of 25,000*l.* in order to complete the new sewerage works. The cost so far has amounted to about 350,000*l.* The extra cost is for additional filter tanks at the Spondon outfall works, the eighteen already fixed having proved insufficient.

## VARIETIES.

It is announced that Mr. J. B. Duckworth, of the firm of Muir, Duckworth & Co., has joined the Head Office Board of the London and Lancashire Fire Insurance Company.

A new theatre is to be built in Dundee in the vicinity of Murraygate. A site has been secured by Mr. R. A. P. Williams, the manager of the Gaiety Theatre, Dundee. Accommodation will be provided for 3,000 persons.

At a public sale at Rochdale last week a row of nine houses in Lomax Street, Rochdale, was sold for 50%. After meeting all charges against the property there remained over 22% a year.

The City Council of Vienna has voted 1,250,000% for the extension of the municipal gasworks. The work will be spread over seven years, and it includes very large additions to the existing gasworks and the erection of entirely new plant in 1911, when the remaining contracts of the British company known as the Imperial and Continental Gas Association will expire.

MISS JEKYLL, the authoress of "Old West Surrey," has placed her collection of old cottage furniture, ironwork and objects of domestic antiquity at the disposal of the Council of the Surrey Archæological Society. There is probably no collection in England of equal value in its kind. The Council have accepted the gift, and there only now remains the provision of means to enable it to be shown to the public, either at the Society's museum, Castle Arch, Guildford, or elsewhere.

AFTER deliberations extending over nine years, and much delay in consequence of legal difficulties, Evesham appears likely soon to secure a public hall more suitable to the requirements than the existing buildings. At a special meeting of the Town Council on Tuesday it was agreed that application should be made for sanction to borrow a sum not exceeding 8,000% for the alteration and enlargement of the public library and institute buildings.

At the sitting of the Alloa Dean of Guild Court, Dean of Guild Wilson, who presided, in submitting a statement regarding the business of the Court for the past year, said the estimated value of the dwelling-house property was 6,463%, as against 10,227% in the previous year; while the average

for the last five years was 14,825%. The estimated value of works and shops was 5,077%, as compared with 3,428% last year, the average for the last five years being 11,090%.

DURING a discussion at a meeting of the Swanage District Council respecting the repairing of a pavement, it was stated that one of the stones recalled the time of Judge Jeffreys and the Bloody Assize, several of the condemned prisoners having been hanged on the gallows from the stone, which had been taken from its original position and placed in the pavement about fifty years ago. The Council agreed to hand it over to a local gentleman who desired to restore the stone as near as possible to its original position, so that it might be preserved as a memorial.

THE plans and specifications for the construction of the embankments, discharge culvert and other works in connection with the raising of the level of Loch Arklet are now in an advanced state of preparation. The water committee recommend that Mr. George H. Hill, C.E., Manchester, who was consulting engineer in connection with the preparation of the Parliamentary plans, be appointed to consult with Mr. J. R. Sutherland, the water engineer, in regard to the carrying out of the works.

THE report of the sanitary committee of Pollokshaws Town Council, who were inquiring into various phases of housing in the burgh, has just been issued. The committee state that there is no such scarcity in the class of workmen's houses as to demand that the Town Council should embark upon a housing scheme. It is also the opinion of the committee that it is not the proper policy of the Town Council to build inferior houses to be let at rents which would attract the lowest class of occupiers. The policy of the Town Council should rather be to encourage the building of a fair class of workmen's houses, and at the same time to use pressure to close uninhabitable dwellings.

MR. WILSON Fox's report to the Board of Trade on conciliation boards has been issued. It shows that 194 conciliation boards and committees, affecting more than a million and a quarter of workpeople, are in existence, and that friendly discussion at meetings of these bodies, which represent employers and employed, is now a very generally recognised method of settling wages and other matters in dispute in most of the principal trades of the United

kingdom. The value of boards as a means of preventing stoppages of work is shown by the fact that in the majority of cases the rules provide that no suspension of work shall be brought about by either party until the question in dispute has been considered by the Board. Of 7,248 cases settled by conciliation boards in the last ten years only ninety-one, or 1 per cent., were preceded by stoppage of work. The most important boards settle a deadlock by reference to arbitration.

ELECTRIC NOTES.

THE electric-lighting committee of Edinburgh Town Council recommend the Council to supply current to the forthcoming Scottish National Exhibition at a charge of 2d. per unit, with a minimum charge of 1,900l. It was estimated that 328,000 units would be required both for power and lighting, and this is calculated to be equal to a charge between 2,000l. and 3,000l. In connection with the exhibition the electric-light mains will be extended from Orgie and Murrayfield to Saughton.

COLONEL DRUITT, of the Board of Trade, in his report on the Bradford tramway accident last August, when a car ran down a steep decline and fourteen persons were injured, says it was found an axle was broken, but had the slipper brake been more fully applied before the car came to the steepest part of the decline, no runaway would have occurred through the axle breaking. What is required, he says, for cars on steep gradients is a mechanical slipper brake that can be applied practically instantaneously, as once a car gets out of control on a steep gradient, it is impossible to stop it with the brakes at present in ordinary use.

THE Union of German Electrical Industries have dissented from the advisability of reducing prices in consequence of the fall in copper. It was asserted, however, that in spite of the position of copper, there was still less margin of profit than was the case a few years ago, and that therefore advanced prices must be maintained. Regarding raw material it was stated that it was only in copper, which had gone up about 100 per cent. since 1904, that any reduction had occurred, whilst wages and coal still show a decided

tendency to rise. The advances which have had to be made in selling prices from time to time were said to have been considerably less than sufficient to cover the extra works cost, so that the reduction in copper is merely to be regarded as a factor in favour of the electrical companies and not in favour of their customers. It was also stated that the works were busy and had plenty of orders on the books.

A PARLIAMENTARY return published on Friday gives the numbers of persons killed and injured by the "live" rail on railways in the years 1904, 1905 and 1906, and in the first eight months of 1907. During the whole period 16 persons have been killed and 71 injured. Of those killed 4 were railway servants and 12 trespassers on the lines. The injured included 40 railway servants, 1 passenger, 5 persons on business and 25 trespassers. The total figures for the respective years were:—1904, 8 killed, 20 injured; 1905, 2 killed, 18 injured; 1906, 4 killed, 21 injured; first eight months of 1907, 2 killed, 12 injured. The largest proportion of casualties occurred on the North-Eastern Railway, where 8 persons have been killed and 28 injured. The Lancashire and Yorkshire had 5 killed and 19 injured.

THE Dundee electricity committee have had under consideration the allocation of contracts for the plant and equipment of the new generating station to be erected at Carolina Port. The engineer recommended acceptance of the tender of Messrs. Willans & Robinson, Rugby, amounting to 18,676l. 16s. 6d. for the complete generating plant, including condenser, and that of Messrs. Babcock & Wilcox, amounting to 14,935l., for the boilers, &c.; and further, that the same firm's tender of 2,125l. for brickwork settings for boilers and economisers be accepted. In view of the importance of the matter it was remitted to the convener and Mr. Nairn, along with the engineer, to visit Glasgow and other places for the purpose of seeing certain types of turbo-alternators and boilers in operation before coming to a decision. The steam generating plant of the new station consists of four Babcock & Wilcox boilers, economisers, coal handling plant, bunkers, railway sidings, wagon pipe conveyers, mechanical stokers, &c. The electrical generating machinery to be installed consists of two 2,000 k.w. (3,000 h.p.) turbo-alternators of the horizontal type.

**REFILLING TRENCHES IN STREETS.\***

It is pleasing to note that recent issues of engineering periodicals have devoted prominent space to this matter, which is both one of the most important and one of the most generally neglected matters that municipal officials and contractors have to meet in connection with street work.

One of the articles referred to quotes from specifications of the West Park Commissioners of Chicago, which are incorporated in permits granted for making excavations in streets to reach underground service pipes. From the quotation the following extract is of special interest:—

"All material excavated from any trench under paved roadways must be removed from the boulevard; said trench being refilled with clean cinders, sand, gravel or crushed stone, placed in layers not exceeding 6 inches in depth, thoroughly compacted with heavy hand rammers, using the necessary amount of water to complete perfect consolidation of the back filling."

This specification is certainly on the safe side, but for general use in many, if not most cases, it seems to the writer unnecessarily severe and expensive in the requirement that all material excavated from any trench must be removed from the street and replaced by cinders, sand, gravel, crushed stone, &c.

In the case of West Chicago Park boulevards such a general stipulation may be justified by either:—

(a) The importance of not littering the boulevards any more than absolutely necessary and of maintaining their fine appearance as constantly as possible, or

(b) The knowledge, if it is a fact, that the subsoil underlying this section of Chicago is of a character which, after once being disturbed, is unsuitable for backfilling of trenches. Whatever may be the reason and justification for such a claim by the Chicago West Park Commission (and I assume it is justified there), this should not be set out as a generally suitable provision and for all cities and all classes of subsoil. I do not want to be understood as advocating the withdrawal of one iota of the greatest precaution and care in this important matter of backfilling

\* A paper by George C. Warren, read before the Detroit Convention of the American Society of Municipal Improvements.

trenches, carelessness in which is costing an aggregate of hundreds of thousands of dollars annually in damage to pavement and vehicles. On the contrary, my purpose is to endeavour to point out the importance of the matter, and suggest practicable, general requirements for overcoming the difficulty in the most economical way as to the particular case.

With a quarter of a century of experience in street paving throughout the United States and Canada, I believe I have met the matter of backfilling of trenches in all of its possible phases, and I appreciate that it is a difficult matter to draft a specification which will (a) efficient results and (b) a basis of payment for the work which will insure the greatest practicable economy to the city and fairness to the contractor.

The greatest difficulty arises from the fact that the method of treatment and its cost vary very widely with the character of subsoil, which often varies very greatly within the limits of one sewer or water or gas main trench; often cannot be foreseen and often varies with the weather conditions (wet or dry) which happen to prevail.

Before attempting to offer a solution I will mention a few instances which have come to my notice. There is a popular notion that trenches should be allowed to settle a year before paving and that then the work is safe. This is not only a fallacy which breeds carelessness in construction, where it is thought no pavement will be laid in a year or more, but it is impracticable to defer paving until a year or more after all mains and house connections are made, equally impracticable to avoid cutting into pavement for installation of and repairs to service pipes, although the latter can be guarded against by the exercise of reasonable precaution much more than is generally done.

We all know that by careless or indifferent backfilling of trenches unpaved streets are often rendered dangerous and nearly impassable for years. I remember about fifty years ago an instance in one of our older cities, where asphalt pavement was being laid, replacing an old cobble pavement. The cobbles and a few inches of the underlying earth necessary to provide the sub-grade were removed, the sub-grade rolled with a steam-roller and a concrete foundation laid. While the concrete was "setting" there had been a good deal of rain, and at one point in the street

the concrete settled and developed a hole, into which a hoe handle was inserted the full length without finding the bottom of the hole. Investigation and subsequent examination developed a serious hollow, several feet deep, about two feet below the service and over 200 feet long over a sewer which had been laid twenty-five years before, and doubtless backfilled in what is still the quite generally customary way of merely throwing the earth loosely back into the trench. In this case a crust or arch of solid earth had become formed, which did not develop the hollow below until the excavation for the new pavement removed a part of this crust, and the rains caused the balance of the crust in one spot to fall into the hole. In another instance no trouble developed in the construction of an asphalt pavement laid on concrete foundation, but three years later a horse's hoof broke through the surface of the pavement and he broke his leg. Here examination revealed a hole 6 feet deep, which it took fifty loads of earth to fill, over a sewer trench ten years old.

It is very common for a pavement to settle a year or more after it is laid along the line of a sewer trench filled several years before the pavement, where no trouble developed during the rolling and laying of the pavement. It is still more common to find almost insurmountable difficulty from settlement of old trenches while the paving work is in progress.

So much for the theory that, however carelessly a trench or fill is made, it will settle itself within a year. On the other hand, I have never known of a case where trouble has followed from the settlement of sewer or service-pipe trenches made immediately before the laying of the pavement where I had supervision of the backfilling, even with very treacherous soil conditions. I would far rather take my chances on the guarantee of a pavement laid immediately after a sewer trench, the filling of which I could control, than five years after the laying of a sewer, the trench of which was filled with the generally customary carelessness and usual view to the least possible cost only.

About two years ago I was going over a street about two miles long in the Middle West, for the paving of which bids were about to be received. A sewer, the trench of which was from 15 to 20 feet deep to a clay soil, was being built, using an excavating machine which backfilled without

tamping. On account of the looseness of the fill the level of the roadway over the trench was being raised about 18 inches, sloping to nothing near the edge of the road. An inspector was standing over the work, and I asked him to show me the specifications. They clearly provided for "thorough tamping of the trench in courses, not more than 6 inches." On calling the inspector's attention to the provision he first claimed that it only referred to paved streets. I showed clearly that this was not the case, and explained that my interest in the matter was as a bidder and possible contractor for the pavement to follow, and received the following retort:—"You don't shuppose Misther Murphy (naming the contractor) is going to fill the sewer for youse!" The outlet of the same sewer passed through a paved street, which I found was actually being filled, without any tamping whatever, with tipcarts loaded from the excavation by buckets and hoisting engines. An appeal to the engineer brought a promise to investigate any continuation of the trouble, and further inquiry brought out the explanation why this provision of the specifications was not generally complied with—that contractors did not figure on doing so; that the price showed the contractor did not figure on doing so, and so it would be a hardship to force him to the expense, and that as the pavement would not be laid for a year the trench would probably be settled by that time. This is only a somewhat aggravated case of what happens to-day, I believe, in fully three-fourths of the sewer-trenches which are being built every year.

Now for the remedy, which is more difficult than to call attention to the common faults.

In case of permits to public service corporations, plumbers and abutting owners to cut into the streets, whether paved or unpaved (the former is but little more important than the latter) it is only necessary to stipulate in the permit that "the trenches shall be backfilled by such means as the city engineer may direct, depending on the character of the excavated material, in such a manner that all excavated material shall be replaced in the trench without raising the grade of the roadway. Flushing will only be permitted in cases where the subsoil is sand or gravel or other material from which the surplus water will readily drain away."

In criticism of this proposed requirement reference may

be made to the volume of the pipe. My reply is that except in trunk sewers (which do not apply to the permits referred to) the volume of the pipe is so little, in comparison to the volume of the trench, as to be insignificant, and it is well known that, in ordinary cases, more earth can be tamped into a trench than is removed from it. There is the familiar farmer's post hole, which will take the earth removed from the hole and the post besides. In my judgment the only case where the rule of "get back all the dirt" cannot apply is in rock excavation, in which case, the breaking up of the rock nearly doubles its volume, and the pieces of rock are so large that they cannot be replaced, to their original density.

In the case of contract work for sewers, &c., the case is more difficult, in view of the necessary uncertainty of conditions to be met under ground and consequent uncertainty of the most economical way to properly backfill the trench and consequent impracticability of the contractor accurately figuring in advance what the cost per linear foot will be. On this account some contractors are sure to bid far too low to permit proper work, and others figure "safe," with the probability that if they happen to receive the contract the price will be too much advance on the probable cost. In one case the city has the almost impossible task of forcing the contractor to do proper work when the price is too low to permit it without loss. In the other case the probability is that the city will pay too much for the work. An effort should be made to avoid both evils.

#### IMPERMEABLE CONCRETE.

ONE of the most desired characteristics of concrete at the present time in connection with its physical resistance to the results of loading is impermeability to water. Although the ultimate compressive resistance of the strongest concrete is far below that of the best natural building stones, it is high enough to meet the exacting requirements of masonry in most engineering structures, and its lack of tensile resistance is effectively cured by steel reinforcement. In spite of the fact that its real merits, intrinsically of a high order, have at times been greatly exaggerated and grossly

overworked by ignorant and ill-judged advocates, concrete is rapidly becoming one of the most valuable of all our structural materials for engineering purposes, if, indeed, it has not already reached that position. It is employed in many cases where its main function is that of carrying loads, but at the same time where the quality of real impermeability would add greatly to its value. This is not only true in an extended range of engineering structures, such as dams and aqueducts, but also in its application to buildings both *en masse* and in blocks. If concrete could be given a truly impermeable character its value would be greatly enhanced and its field of usefulness would be even more rapidly extended than at present.

The great obstacle heretofore experienced in making concrete waterproof, says the *Engineering Record*, has been its highly porous character. With the dry mixtures used in times past the porosity of concrete was excessive, and not the least of the many advantages accruing to the use of wet mixtures is the greater solidity or density conferred upon the mass. A wet mixture not only causes all portions of the mass to run together in greater solidity, but it enables the finer materials of the aggregate to flow freely and thoroughly into the spaces between the coarser particles, thus producing a much more nearly continuous and dense interior mass. This means obviously a greatly reduced permeability to water or a much enhanced capacity to resist seepage through it. In fact, if the cement were ground sufficiently fine to enable it and the finest parts of the sand to enter freely into all the interior spaces of the aggregate a waterproof material under high intensities of pressure would result; but the wettest mixtures which it is possible to use neither eliminate all the air bubbles nor fill all the interior spaces. However much care may be taken in securing a thorough and intimate admixture of the component parts, all porosity is not eliminated and some seepage results under pressures of 40 to 60 lbs. per square inch or even less.

If suitable mixed concrete could be put under a high pressure before the initial set takes place, so as to squeeze out all air and surplus water, should there be any, in much the same way as molten steel is compressed in order to produce grades of that metal of special value, it is altogether probable that the resulting density would be suffi-

ment to secure essential impermeability under very high heads. This obviously is impossible, but some recent investigations appear to indicate that there may be other simple means of attaining the much-desired quality of impermeability. In a discussion by Mr. Richard H. Gaines of the paper presented to the American Society of Civil Engineers in April of the current year by Messrs. V. B. Fuller and S. E. Thompson, there are set forth some results of tests made to determine the effect of the addition of certain substances on ordinary concrete mixtures. In the search for materials which may enhance the waterproof character of concrete it is clear that none must be used which will prejudice the resistance or durability of the mixture. Mr. Gaines, who is the chemist of the New York Board of Water Supply, shows that the addition of small percentages of alum solution and fine clay to Portland cement mortar and concrete enhances greatly the impermeability of the mixture and that both compressive and tensile resistances were increased. Although the number of the tests was relatively small and the life of the test specimens was not long enough to settle conclusively such a question as that under consideration, the results obtained show that the line of investigation followed is worthy of being carried further in order to determine just what value may be attached to the mixtures of such materials as were employed with the usual proportions of cement, sand and gravel, or broken stone in the manufacture of mortar and concrete.

It has been indicated by tests that, contrary to the former opinions of engineers, the presence of small percentages of fine clay of a suitable character and properly mixed does not necessarily injure the strength of concrete, and it has also been shown that the same mixture may aid in attaining more nearly waterproof qualities. Up to the present time, however, investigations of this kind have not been carried far enough to give quantitative results of sufficient range for practical purposes. It has generally been considered that the effect of fine clay in reducing the porosity of concrete was wholly mechanical, but the modern view of physical chemistry, so to speak, may disclose a different significance to the results of use of fine clay for such a purpose. With the modern wet concrete mixtures, the presence of the clay is asserted by Mr. Gaines to induce

a colloidal action which is apparently aided by such a solution as that of alum, so that the result is a modification of the interior mass, tending to eliminate ordinary porosity.

There is nothing new in the employment of an alum solution as well as various soap solutions to afford concrete a certain degree of impermeability to water, but the purpose hitherto has been to produce an impermeable surface rather than an impermeable mass, which the results of Mr. Gaines's experimental work appear to indicate as attainable. The great advantage of securing an impermeable or waterproof mass of concrete over superficial effects is so clear as to need no comment. This observation is especially pertinent to all reinforced concretework, in which it is of the first importance to protect the steel reinforcement from corrosion. It is to be hoped that in its investigations connected with the construction of the Catskill aqueduct, the Board of Water Supply will extend its investigations thoroughly into the field indicated by the results already obtained by Mr. Gaines. At the present time it is difficult to imagine any greater benefit to be conferred upon all classes of concretework than to find some simple and effective method of making it waterproof under reasonably high pressures. Such an investigation should also include tests with hydrated lime and the various proprietary waterproofing compounds now extensively used, some of which seem to be giving good results when added to the usual concrete mixtures.

### SMOKE ABATEMENT.

A LECTURE was given in Manchester on Saturday by Mr. R. H. Clayton, vice-president of the Chemical Club, on the problem of smoke abatement. In the course of it he said that the solution of the smoke problem must come by attacking the domestic fire. He agreed with Dr. Bailey and other authorities that about 70 per cent. of the smoke in the atmosphere was from domestic chimneys and the rest from factories. Anyone must notice in passing over the viaduct at Stockport or London Road, or in such a view as that of Salford from Kersal Hill, that the houses are always enveloped in a cloud of whitish smoke. People were apt to consider that this whitish smoke was not so noxious as the smoke from the factory chimneys, but some

## No. 2 "SIGNET" Combined Range and Sitting-Room Grate.

Very suitable for Small Houses, Country Cottages, Flats, &c. (Patented).

Combines in itself in a practical and efficient manner the essential features of a Cooking Range and Sitting-room Grate.

ATTENTION is specially directed to the "Signet" Patent Combined Canopy and Damper with which all these Grates are fitted. It will be found to be of great use as a FUEL ECONOMISER by adjusting it so as just to permit of the smoke getting away, but no more, thus preventing the escape of warm air into the chimney, and giving the radiating power of the Grate its full value as a means of warming the apartment; also as a baffle against draughts, &c. IT IS THE ONLY GRATE OF ITS KIND POSSESSING THIS IMPORTANT FEATURE.

Has been THOROUGHLY TESTED and has given UNIVERSAL SATISFACTION. This Grate can only be supplied through Builders' Merchants, Ironmongers, &c. Copies of unsolicited testimonials and further particulars may be had from the Makers,

results he had got would show that it was more so. Taking the average consumption of coal for domestic purposes as  $1\frac{1}{4}$  tons per head per annum, the total annual consumption for England would be 50,000,000 tons altogether. The coal consumed by factories, iron foundries and other trades amounted to 65,000,000 tons per annum, but a great deal of this was used for purposes which were absolutely smokeless. Take, for example, the Mond gas plants; these in the neighbourhood of Manchester alone would account for 1,000,000 tons a year, and the process was completely smokeless. Another cause which was bringing about the diminution of factory smoke was the growing use of mechanical stokers. Mr. Clayton instanced the two chimneys of the Salford Corporation electric-lighting station, where mechanical stokers were used; it was marvellous how little smoke was emitted; one might almost imagine they were never working there. It was the same in the Manchester electricity works. These two establishments alone accounted for about 100,000 tons per annum. Only part, therefore, of coal used in factories, &c., was burnt in a smoke-producing way. In the emission of smoke, Mr. Clayton said that the percentage of loss from this cause in the case of a factory chimney was very small; it could be calculated as 1, 2 or 3 per cent. of the fuel, whereas the loss in the case of a domestic chimney was something like 50 per cent.

The distinctive characteristic of domestic smoke is that it is laden with oily hydrocarbons (tarry oils) and ammonia, owing to its being produced at a low temperature, whereas factory smoke is nearly all pure carbon. In the following analyses of domestic smoke, factory smoke and the Manchester atmosphere, these constituents are calculated according to the proportion they bear to the amount of pure carbon. The analysis of the polluting matter in Manchester air shows that it approximates most nearly to domestic smoke, as shown by the amount of tarry oils, ammonia and other constituents that are characteristic of domestic smoke. The comparatively innocent appearance of a domestic chimney was due largely to the fact that a large amount of the smoke came off in the form of these oils, which, when in a hot and vaporous state, were colourless, not black like factory smoke. Another reason for the better appearance of domestic smoke at the actual moment of being poured out

was that it was diluted with a much larger amount of air. Ten times as much air in proportion to the amount of coal burned passed up a domestic chimney as passed up a factory chimney. Pointing to a diagram of an ordinary domestic grate and a gas retort, the lecturer observed that they were constructed on very much the same principle. Both were distilling the coal, but in the one the products of distillation were poured into the air, in the other they were collected and used as valuable industrial materials.

In calculating the cost of the smoke nuisance, Mr. Clayton pointed out that if we put the cost of extra cleansing, &c., at only a halfpenny a day per head, it worked out at 500,000 a year for Manchester alone. After reviewing various possible solutions, he said that coke and gas were the most promising. But gas at 2s. 3d. a thousand, or anything over 2s., was too heavily handicapped. They ought to endeavour to supply gas as cheaply as possible. Manchester spent 64,000l. a year on the purification of sewage to prevent the pollution of the rivers; on the other hand, they were handicapping the much more important purification of the atmosphere by taking 60,000l. a year out of gas for the rates.

### LIGHTING OF EDINBURGH.

THE report by the inspector of cleaning and lighting for the year to May 15 states that for some time past earnest and continuous efforts have been made to effect improvements in the gas lighting of the city, and in this respect the municipal year 1906-7 has proved a record one. It has been marked by the disappearance of all the flat flame burners, for which incandescents have been substituted. The superior illumination of the incandescent burner over that which it has displaced is so great that as a whole the result marks the completion of a lighting transformation which may be said to constitute an epoch in the lighting of the city. Edinburgh with its electric lighting of its main thoroughfares and car routes, its incandescent illumination of its other streets and of its courts and closes, and its stair lights burning from sunset to sunrise, has now reached a stage of effective lighting which commands the approbation of the citizens and elicits commendation from visitors and other municipalities.

THE "ZETA" WOOD FLOORING CO. LTD

CRISPIN'S WHARF, MARSHGATE LANE, STRATFORD, E.  
CITY OFFICE: 28 FENCHURCH STREET, LONDON, E.C.

At May 15, 1907, the streets, &c., of the city were lighted by 9,940 incandescent gas lamps, 1,175 electric arc lamps, and the common stairs by 12,123 gas jets and 70 electric lights. In the previous year the number of gas lamps was 10,118, which has been reduced by 178. The improved lighting in the streets has created a desire to have the stairs lighted with the incandescent burner. By way of experiment this burner has been introduced into a few stairs. The lights, however, being unprotected and easily injured, there is at least meantime little prospect of progress in this direction. The number of stairs incandescently lighted is 13 with 36 jets. For some quarters of the city, where better-class houses are being erected and electric mains are available, there is a disposition to have the stairs lighted with electricity. Progress in this direction is so far not considerable, but there are indications of growth. The number of stairs electrically lighted is 36 with 70 lights.

The total expenditure on lighting was 43,600*l.* os. 1*d.*, of which 21,434*l.* was for street gas lighting, 10,272*l.* for electric lighting and 11,893*l.* for stair lighting. The cost of the conversion of flat flame burners into incandescents was 10,725*l.*, an amount which has been spread over three years. The retiring allowance to old and enfeebled members of the staff amounted to 122*l.* os. 7*d.* The cost per arc lamp has been reduced from 20*l.* in 1895-6 to 9*l.* in 1906-7. The total expenditure of the lighting department (43,600*l.*, less a revenue of 5*l.* 5*s.*) works out at 2*s.* 6½*d.* per head of the population and 3½*d.* per 1*l.* on the assessable rental.

### NEW PHYSICAL LABORATORY, EDINBURGH.

The physical laboratory which was established in 1868 by Professor Tait, and was situated in the Old University Buildings, will, at the beginning of this winter session, be transferred to a building of its own. This has been made possible by the purchase from the city of the buildings and site of the city hospital by the University Court, and by the grant made to the University by the Carnegie Trust for transforming these buildings into a physical laboratory.

The building which has thus been transformed, says the *Scotsman*, consisted of the old surgical hospital of the infirmary. The outer walls of the old building, the inner

walls and the old staircases have been utilised, wholly or partially, but the wooden flooring has been replaced by concrete supported on steel girders running east and west to avoid magnetic disturbances. The plaster on the walls has been removed and replaced by a surface of tinted Parian cement. The heating arrangements consist of a low-pressure steam-heating system, and for ventilation purposes three electrically-driven fans have been supplied. The building throughout is fitted with incandescent electric lights; there is also gas, chiefly for experimental purposes.

A gap of 5 feet has been cut between the north block of the physical laboratory and the engineering laboratory, to avoid any vibration that might be caused by the heavy machinery of the latter department. A stone bridge connects the Drummond Street level of the grounds with the main entrance to the building, and this leads to what has now become the principal floor. Directly above the main entrance, on the face of the building, the University coat of arms has been inserted in stone.

On the principal floor there are the chief lecture-room, an apparatus-room, the professors' rooms and a library and reading-room. The chief lecture-room, which will accommodate from 200 to 250 students, is fitted with hinged flap-seats, and is so designed that students, wherever seated, have an equally good view of experiments, whether conducted on the lecture table or on the experimenting space in front of it. The large lecture table is supplied with current, gas, water and other requisites necessary for experimental demonstrations. Behind the table are three large sliding blackboards, their area being such that, in general, they will not require to be cleaned during a lecture. There is a lantern screen behind the table, so placed that it can be equally well seen by all the students—the light from the lantern, which is set in a gap in the lecture-table, being reflected from a mirror on to the screen.

Under the lecture table there is a room to enable improvements in lecture experimenting to be adopted, and in which gasometers, boilers and other heavy or bulky pieces of lecture apparatus can be manipulated, and the blackboards and lantern screen slide down to this room. Above the ceiling over the lecture table is an attic-room, the floor of which has a series of openings for experiments on long pendulums, falling bodies, &c., and a free drop of

York Mansion, York Street, Westminster, S.W.

45 feet can be obtained. Above the lecture table, on the wall facing the audience, is a gallery for diagrams and suspension experiments.

There are three entrances to the lecture-room, one for women and two for men. The women's entrance is on the principal floor and a cloak-room has been provided for them below the seats; the men's entrances are on the principal and upper floors, and with cloak-rooms adjoining.

Opening off the lecture-room is the preparation-room for the preparation of experiments and distribution of electric power. There are also small rooms for the preparation of diagrams and lantern slides. The apparatus-room, immediately opposite the preparation-room, is for apparatus for lecture purposes, laboratory apparatus and standard instruments being in the rooms in which they are required.

The library and reading-room is a well-lit, handsomely-appointed room for the use of students attending lectures or engaged in experimental work, and has shelved alcoves on one side. It is hoped in time to have a moderately extensive collection of books and periodicals on physical subjects.

The students' laboratories occupy the whole of the upper floor. The junior arts and science laboratory will accommodate forty-five students, and is fitted with tables, benches and wall apparatus for elementary experiments. The senior laboratory consists of a suite of seven rooms for mechanical, thermal, electrical, optical and acoustic work, the fittings being suitable for the kind of work intended to be performed. There are also a small workshop and photographic-room for the use of students in the laboratories.

The tower of the building contains a lift well and a shaft, and there is an experimenting space on the roof, which is reached by a wooden ladder inside the lift well, which, it is hoped, will be replaced, when funds become available, by a lift to enable heavy pieces of apparatus to be conveyed to the upper portions of the building and to the roof. The shaft is for the suspension of long wires, for a mercurial pressure gauge and other purposes requiring a considerable height.

On the ground floor are most of the research-rooms, of which seven have been fitted up; there is, however, a large space available for extension. Although each room differs

in regard to particular features, they are all adapted to a considerable range of work, having firm concrete floors and stone shelves built into solid walls, and they are supplied with high and low-pressure water, gas, electric light and current. In one of the research-rooms—the gun-room—Professor Tait's compressibility apparatus has been fitted up, and in another—the guillotine-room—his impact apparatus has been installed. In addition, there are the accumulator-room and the workshops; the complete fitting up of the latter has been deferred for the present. On the ground floor also is a lecture-room capable of holding eighty students for the classes in applied mathematics and the more purely mathematical classes in natural philosophy; it is furnished with rising seats and large blackboards and the necessary experimental arrangements.

In the entrance hall on the principal floor are cases for historical apparatus, associated with the names of Leslie, Forbes and Tait.

Since the building was designed the tutorial system has been introduced, and has proved so successful that it has become necessary to provide tutorial classrooms. The arrangements made at present are of a temporary nature, certain rooms intended for other work being utilised for this purpose. Another problem which has recently arisen is the provision of suitable accommodation for the recently instituted student-teachers' courses, and they are at present provided for by the giving up of two of the rooms of the senior laboratory. In the unfinished wing there is a large room which Professor MacGregor hopes will be fitted up at an early date for the teachers' class.

The boundary wall in Drummond Street is part of the old city wall, and the main entrance gate was once the entrance gate to the old infirmary, and as interesting historical monuments both wall and gate have been left intact.

The work of reconstruction has been directed by Messrs. Sir Rowand Anderson and Balfour Paul, architects. At all stages they have had the advice of Professor MacGregor, the head of the department, who has made a careful study of the most recent and complete laboratories in Britain and America and on the Continent. The work has been supervised by Mr. A. E. L. Clark, the University's superintendent of works.

WINLATON.—Nov. 19.—For alterations and improvements at Winlaton Council schools, Durham. The County Education committee's architect, Shire Hall, Durham.

AN exciting scene took place at Limerick Corporation recently when the election took place of a borough electrical engineer. There were 120 applications, and a committee recommended the appointment of Mr. P. T. MacNamara, a Limerick man, and a member of the Engineering Association of Ceylon. It was moved, as an amendment that the applications of the candidates declared to be qualified should be submitted to an electrical expert to select therefrom twelve. It was pointed out than an electrical expert had been appointed to examine Mr. MacNamara, whose recommendation by the committee was unanimous. An exciting discussion ensued, during which a great deal of disorder prevailed outside the barrier, and the chairman had to requisition the services of the Mayor's sergeants to restore quietude. Alderman Donnelly said the members had to leave the committee-room because of bullying and fear of physical chastisement. The chairman denied that there was any bullying. Another member asked was it not a fact that one member called another a robber? The chairman said it was not a fact. Councillor Cuddely said that some members wanted an Englishman or Scotchman appointed to the position, but not a Limerick man. In the result a poll was taken, and by sixteen votes to four Mr. MacNamara's appointment was confirmed, subject to his examination by an electrical expert.

TRADE NOTES.

THE system of the United Kingdom Fireproofing Company, Ltd., has been adopted for the London Joint Stock Bank, Kingsway. The whole of the fireproof floors and roofs will be on their combination system of ferro-concrete beams and terra-cotta tubes. The whole of the fireproof floors, roofs and staircases of the new chemical laboratory, Cambridge, will also be constructed on the ferro-concrete beam and tube system. Both these jobs are to be carried out without centring.

THE additions to the Reigate and Redhill hospital are being warmed and ventilated by means of Shorland's patent Manchester grates.

A CHIME clock, with two large external dials, is now erecting at Brodsworth parish church as a memorial. The work is in the hands of the makers, Messrs. Wm. Potts & Sons, Ltd., Leeds and Newcastle, and will be completed by an early date.

THE British Consul at Christiania announces that the Corporation of Vardo have issued a call for tenders for the supply and delivery of 290 tons of cast-iron pipes, 38 tons of galvanised asphalted steel pipes and a number of halves, besides other material. Tenders are to be delivered by November 30, 1907, to "Stadsingenioren," at Vardo. Copies of specifications, conditions and drawings may be inspected by British makers at the Commercial Intelligence Branch of the Board of Trade.

HOLY TRINITY CHURCH, Exmouth, Devon, was consecrated on Wednesday, October 30, by the Lord Bishop of Exeter. The tower and nave have been completely remodelled and rebuilt, and a new chancel, chapel and vestries have been added. The work has been well done by Messrs. Wilkins & Sons, of Bristol, at a cost of about 13,000*l.*, under the supervision and from the designs of Mr. Geo. H. Fellowes Prynne, F.R.I.B.A., of 6 Queen Anne's Gate, Westminster.

MARPEDO WHITE JAPAN

SLOW DRYING.

Suitable for either exterior or interior High-Class Decorative Work, invaluable to Architects, Decorators, Ship and Yacht Builders, Railway Companies, &c. It is easy to manipulate, and large areas can be covered evenly. When dry it presents a hard, brilliant and durable surface, which will not crack. On properly prepared surface one gallon of MARPEDO SLOW-DRYING WHITE JAPAN will cover about 80 square yards. It dries in about 12 hours.

## VARIETIES.

THE plan for building a prison on the Borstal system at Brompton, near Retford, has been abandoned, and an asylum is to be erected on the proposed site.

At the weekly board meeting of the directors of the London and Lancashire Fire Insurance Company, held on Monday last, Mr. George H. Robertson, hitherto deputy-chairman, was elected to succeed the late Mr. Edward H. Harrison as chairman of this Company.

At Glasgow Dean of Guild Court, held on the 31st ult., the Corporation was authorised to construct the substructures of the south side sewage pumping station at the corner of Park Street and St. James Street, Kinning Park. This part of the Corporation sewage scheme is estimated to cost 12,000*l.*

THE Manchester Council have sanctioned the proposal of the sanitary committee to erect a municipal lodging-house for women on land bounded by Corporation Street, Crown Lane and Ashley Lane. The Council were told that if they acted on the lines pursued in Glasgow the new venture would be self-supporting.

At the annual meeting of Glasgow District Building Trades Exchange, Ltd., the chairman stated that a year ago he mentioned that they had in the city at the time some 14,000 empty houses, and from a return which had been sent to him they had that day 15,000 empty houses, or 1,000 more than they had last year.

THE directors of the South-Eastern and Chatham Railway Company and the Dover Harbour Board have approved plans for widening the Admiralty Pier and constructing the new marine station. The work, which is to cost over 500,000*l.*, is for the cross-Channel and Atlantic passenger traffic.

THE Midland Railway Company have decided to construct a training pier at Heysham, consisting of an extensive timber jetty running out 1,000 feet into the sea. The piles are of jarrah wood from 30 feet to 70 feet in length, and these will be sunk into the ground by water pressure. A considerable quantity of embankment, excavation work and rock-getting will also have to be done. The contract is to be completed by the latter part of next year.

A MEETING of the advisory committee for the building and contracting trades was held on Monday at the offices of the Board of Trade. There were present Mr. A. Wilson Fox (in the chair), Mr. Henry Holloway, Mr. H. H. Bartlett, Mr. Edward Goulding, Mr. John Beal, Mr. Thomas Costigan, Mr. James Leslie, Mr. W. Nicholson, Mr. G. J. Stanley, Mr. H. W. Macrosty and Mr. C. L. Maunders (acting secretary).

THE new water-supply for Prestonpans district, which has cost close on 50,000*l.*, was formally turned on without any ceremony. This large outlay has been incurred owing to the foundations and ponds failing to hold the water by reason of their exceptionally porous nature. The new supply is likely to prove of great benefit to a district that in past years has suffered endless trouble and inconvenience.

THE theatres and music halls committee of the London County Council have had before them drawings of the Wesleyan Methodist Hall, which is to be erected on the site of the old Aquarium in Westminster, and for which an application will be made to the Council for a music license. Accommodation will be provided in the various halls, committee-rooms, &c., for 4,950 persons. The committee recommend, subject to certain alterations, the granting of the customary certificate.

THE Court of Governors of the Birmingham and Midland Free Hospital for Sick Children on Monday unanimously resolved the erection of a new building to be a matter of urgent necessity and instructed the management committee to acquire a freehold site in Ladywood Road. The proposed site is not too far away from the centre of the city, and consists of 13,234 square yards and in round figures will cost about 15,000*l.* The site would permit of an hospital being erected with double the present bed accommodation. It is suggested they should provide for 120 beds.

At the last meeting of the Holland (Lincolnshire) County Council a proposal was submitted for the erection of a new bridge over the river Welland at Fosdyke, and it was recommended that Mr. J. Healey Johnson, of Boston, be appointed to advise the committee and to prepare plans of a new bridge, with an estimate of the cost. An amendment was moved in favour of the design being thrown open to competition and a premium of 100*l.* offered, but upon a division the committee's recommendation was approved by seventeen votes to thirteen.

## ILLUSTRATIONS.

MOOR CRAG, WINDERMERE.

UPCOTT HOUSE, OKEHAMPTON.

TURNBERRY HOTEL, AYRSHIRE, N.B.

WINDOWS IN THE NAVE ROOF, ST. MARY THE VIRGIN,  
BEDDINGTON, SURREY.

It is reported that a slight leakage has been discovered in each of the three new reservoirs constructed by the Halifax Corporation at Walshaw Dean, the water falling round the corner of the embankments, and that the main embankments are not defective. The leakages are not regarded as serious by the waterworks committee. The reservoirs have already entailed an expenditure of about 350,000*l.*, double the original estimate. The chief cause of the increased expenditure was the digging of the trenches to a much greater depth than was originally considered necessary.

The magistrate at Brentford police court adopted an unusual method in the case of a schoolboy who had damaged a tree planted by the Corporation at Ealing. He ordered the lad to provide another tree which would meet with the approval of the borough surveyor. He is then to plant it himself, and, failing this, will have to pay 1*l.* and costs. The magistrate said that if the children of this country were brought up as those in Germany and Switzerland, and taught to plant trees in the public highway, there would be less wanton destruction of trees provided by public authorities.

The Local Government Board gave their final decision respecting the Surbiton sewerage scheme when a deputation waited on them. After hearing what the deputation had to say, the official acting on behalf of the Board informed those present that his Board had fully considered the scheme proposed and could not sanction it being proceeded with. The Board advised that a new and less expensive one should be got out and fresh tenders sought for the contract. When that was completed the Board would hold a new

inquiry and give their decision. It should be mentioned that the cost of the sewerage scheme totalled up to over 70,000*l.*, and the accepted contractor was Stephen Kavanagh & Co., whose contract price was 48,810*l.* 16*s.*

The half-yearly general meeting of the Southern Counties Federation of Master Builders was held in Portsmouth on Thursday of last week. The chair was taken by Mr. F. Wallis, of Maidstone (president of the Southern Counties Federation), supported by the Secretary of the National Federation of Building Trade Employers, in addition to members from London, Maidstone, Southampton and Gosport. It was agreed that an organisation committee should be formed, composed of three representatives from each town in the Southern Counties Federation, to meet occasionally and arrange for meetings in various towns throughout the area of the Federation, in order to stimulate and advance their objects. Messrs. S. Salter, M. Coltherup and G. R. Chamberlain were elected as the local representatives on this committee, and Messrs. Salter (Portsmouth) and Marshall (Southampton) on the national committee.

In the House of Lords on October 29 the Lord Chancellor, the Earl of Halsbury, Lord Macnaghten and Lord Atkinson heard the arguments and gave judgment in an appeal at the instance of the Great Western Railway Company against Messrs. S. Pearson & Son, Ltd., the contractors. The point was argued as to whether in regard to the amount due to the respondents in respect of a big contract which they had carried out for the appellants, the Great Western Railway Company, an appeal was permissible on an error of law on the face of the award of the arbitrator acting upon the instructions of the Court. Their lordships dismissed the appeal, holding that no error of law was shown on the face of the award, but reserved their opinion as to jurisdiction on a case where there had been such error. The appeal was accordingly dismissed, with costs.

The Council of the Institution of Civil Engineers have made the following awards for the year 1906-7:—*The Howard quinquennial prize* to Mr. T. E. Vickers, C.B., in recognition of the part he has taken during his career in developing and improving the production of steel for important engineering purposes; *Telford gold medals* to

(Woolwich); *Bayliss prizes*, awarded on the results of the October and February examinations, 1906-7, respectively, to Messrs. F. C. R. H. Boyd (Luxor, Upper Egypt) and D. J. Morris (Swansea).

### ELECTRIC NOTES.

THE West Derby Board of Guardians have discovered, with regard to the lighting and heating of Mill Road Infirmary, that if they had obtained electricity from the Corporation, they would have been charged  $3\frac{1}{2}d.$  per unit. But they had been able to manufacture it themselves for  $3d.$ , thus effecting a saving of  $\frac{1}{2}d.$  per unit, which represented a saving on the last half-year of 104*l.* 6*s.* 9*d.*

THE West Ham Corporation electricity department have secured a contract with the Wholesale Co-operative Society to supply their flour mills and their soap factory at Silvertown with electrical power for all purposes. The contract is based on an annual consumption of 5,500,000 units—a supply which exceeds in amount the total output of many towns which have municipal electricity undertakings. For power purposes West Ham charges only one penny a unit, and gives special discounts to large consumers.

THE new electricity generating station erected by Greenock Corporation in Dellingburn Street has been opened. Some time ago the municipal authorities decided to build a refuse destructor, and as the existing electricity establishment in Hunter Place has been producing its full capacity of current for several years, it was further resolved that the heat available from the burning of the refuse should be utilised for raising steam for the production of electricity. Although the destructor is not yet completed, the latter part of the scheme has now been inaugurated, and the Corporation will thereby be enabled to meet the growing demand for electricity, both for lighting and traction purposes. The total cost of the destructor and electric-power station is estimated at about 41,700*l.*

SIR ALFRED HICKMAN is laying down a complete new steel plant at his Spring Vale Works, near Wolverhampton, at an estimated cost of nearly 100,000*l.* The new mill is being built on the latest American principles, and will be worked entirely by electricity, being the first mill in England worked on this principle. It will be capable of turning out every class of heavy steel bars, plates and girders, and will have a capacity largely exceeding that of any mill in this country. The metal ore will now be run direct from the furnaces into a patent mixer, and being converted into ingots will be conveyed in a malleable state to the mill, where it will be rolled down into bars or plates as required. The new system will accelerate the production of steel and also secure more uniform and better results. It is expected that the mill will be completed early in the new year, and the Staffordshire Steel and Ingot Works will then be the best-equipped works in England, and capable of meeting the severest competition from America or Germany.

A LOCAL GOVERNMENT BOARD inquiry was held at the Surbiton Council Chambers last week by Mr. H. R. Hooper, respecting the application of the District Council to borrow 20,000*l.* for the purposes of their electric-lighting scheme. The original agreement entered into by the Council with the Messrs. Callender was that the Council would retain possession of the electric-light works at the end of twenty-five years, if desirable. In December, 1905, the engineers, Messrs. Talbot & Stevenson, recommended that a further loan was necessary to extend the works. The original loan, which

## CABOT'S INSULATING AND SOUND-DEADENING QUILT

PREVENTS THE TRANSMISSION OF SOUND through walls and floors by absorbing and breaking up the sound waves. No other Deafener does this.

KEEPS OUT HEAT OR COLD exactly as do the feathers of a bird; providing innumerable minute dead-air spaces, giving highest insulating power. Will save enough fuel in a single Winter to pay for itself. Keeps a room warm in Winter, cool in Summer. DECAY, MOTH, AND VERMIN PROOF, AND UNINFLAMMABLE.

Scientific investigation has proved that for HEAT INSULATION or SOUND-DEADENING the highest degree of efficiency, with economy in cost and extreme durability, has been attained by CABOT'S QUILT

had been expended, was 50,000*l*. A difficulty had arisen as to whether this agreement with Messrs. Callender was ultra vires, inasmuch as the formal sanction of the Board of Trade had not been obtained previously. That sanction was given in July 1907. The original loan had been exceeded by 2,600*l*. The demands on the works had increased. The money was required for an additional engine and dynamo, for which it would be necessary to extend the engine-house. They proposed to add 21 feet, giving sufficient accommodation for two engines. It was also proposed to extend the boiler-house, and there were additional services and heaters required as from March 1907 to 1910, and extension of mains.

### BUILDINGS ON SMALL FARMS.

An interesting scheme is being promoted in connection with the agricultural section of the Scottish National Exhibition in Edinburgh under the joint direction of the exhibition executive and the Highland and Agricultural Society. The competitions are promoted with the object of encouraging the devising of improved buildings for small holdings. The scheme falls into three classes, and under the first class a first prize of 5*l*. and silver medal, a second of 2*l*. and bronze medal, and third a bronze medal, are to be awarded for plans and specifications of buildings suitable for holdings not exceeding 20 acres in extent. The buildings are to include a dwelling-house of at least four apartments, and accommodation for one horse, two to four cattle, two to four pigs and poultry. The cost is not to exceed 350*l*. Slightly higher premiums are to be awarded for a one-pair of horse farm, and here the buildings are to include a dwelling-house of four to five apartments and accommodation for at least two horses, about ten to twenty cattle, four to six pigs and poultry, with cart and tool shed and barn suitable for small threshing machine. The cost should not exceed 50*l*. Special attention is asked as to economy in cost and durability and comfort, plans being drawn to a scale of a quarter of an inch to one foot. It is proposed that part or whole of the premiated designs should be erected in the exhibition grounds on a site to be allocated, and competitors are requested to state whether or not they would

be willing to erect full-sized models at their own cost, or upon what other conditions they would arrange to do this. Medals are also to be awarded for building materials suitable for the erection of small holdings with special regard to their economic value and ease of transport and accessibility, and implements for small holdings.

### DRY SANITATION.

The second edition of a brochure by Mr. J. Donkin, F.R.I.B.A., published by Messrs. Spon, Ltd., and entitled "Conservancy; or, Dry Sanitation *versus* Water Carriage," has appeared. As the title suggests, the author recommends that arrangements should be adopted for converting animal refuse into a dry manure. The London County Council cannot avoid dumping sludge into the sea. Mr. Donkin suggests the general use of earth closets of a special kind, of which several illustrations are given. He is supported in his conclusions by what has been laid down by sanitarians of large experience, and maintains that by an extension and improvement of the practice by the Rev. Henry Moule, the public health would be benefited and agriculture promoted.

A COUNTY sanatorium for Argyllshire is shortly to be erected near Oban, according to plans prepared by Mr. Neil Gillier, architect, London. The sanatorium will consist of a pavilion for patients in the initial stage of the disease, an isolation pavilion for the accommodation of serious cases and a pavilion for paying patients. The laundry block will be fitted up with the most modern plant for disinfecting, &c. The first-mentioned pavilion is to be built in butterfly form, after the style of the pavilions of the Victoria Hospital for Consumptives in Edinburgh. This pavilion will consist of a ward for male and female patients, each having accommodation for seven beds. The pavilion will be flat-roofed, and roofed-in shelters will be erected at each corner of the building. There will also be two dressing-rooms for patients and a nurses' room. The isolation pavilion will have a male and a female ward, each having three beds. Shelters and chalets will be erected in various parts of the ground.

## NEW CATALOGUES.

WE lately noticed the catalogue of sanitary specialties from Mr. W. E. Farrer, of Birmingham. We think it would be of advantage to the public to suggest a couple of the arrangements. One is a back-to-back fireclay lavatory, which has been adopted in some public institutions for boys. It will be observed that there are several inde-

FIRECLAY LAVATORIES.

pendent lavatories, but they are fixed back to back and supported on strong cast-iron standards. They are able to withstand rough usage should discipline be relaxed. The lavatories are fed through half-inch gun-metal valveless taps, and the supply is controlled by a stop-cock at the end of the range. Ordinary screw-down taps can be supplied, if desired, as well as galvanised wrought-iron waste-pipes discharging into a glazed fireclay channel. From the

character of the design a range of the lavatories, however long, has not the depressing appearance which is too common in schools and institutions. We also show one of the slop-hoppers for hospital use. It will be observed that this is a compound apparatus which serves several purposes. There are other varieties of the hopper, for Mr. Farrer has

HOSPITAL SLOP HOPPER.

given much attention to hospital work, and provides fittings, sinks, operation tables, baths on wheels, &c. The whole catalogue sustains his claim to be considered an engineer and sanitary specialist.

THE catalogue of the "Stellite" electric heaters, manufactured by the Electric and Ordnance Accessories Co. Ltd., Birmingham, has a double claim on our attention. It

the first place there are two systems of heating, viz. the "Rivers" system, in which a large number of heating units working at a low temperature are employed; the "Eclipse" system, in which fewer units working at a medium temperature are used. Both have already met with a large measure of success. The heating is accomplished by convection, the heaters being so designed that there is an induced draught of air entering at the bottom of the heater, which passes over and through the heating units and issues from the top at a considerably higher temperature. By this method great uniformity of temperature is attained, as all the air in a room is in a very short time rapidly passed many times through the heater. The designs for the heaters also demand attention, and might well be referred to as evidence of the designing power which is now, fortunately, characteristic of a great part of the products of Birmingham. In the first place the purpose of the heaters is frankly recognised. The cases or bodies have nothing in common with the old-fashioned grates or gas-stoves. Brass, copper, armour and wrought-iron are employed. But throughout handwork imparts character to the material. In the catalogue will be seen examples of the styles which are now preferred, and on a short notice special designs can be supplied in Sheraton, Adam, Chippendale, Jacobean, Georgian, Tudor, Queen Anne, Louis XVI. or any of the French styles. Ship-heaters of no less refined character, while suggestive, are adapted for use on ships, while others are well fitted for factory purposes.

The company also make a specialty of motor and starting gear which can be employed for industrial purposes. The block will suggest one of the arrangements showing the ironclad switch in the "on" position. It is claimed that "the complete panel, combining as it does the undoubted superiority of our ironclad switch with the absolute reliability of our various forms of starters, constitutes a very important advance on the apparatus hitherto employed, and one which has already met with the expressed approbation of leading consulting and electrical engineers, besides complying with the latest requirements of the Board of Trade, Home Office, fire insurance offices, &c. So far as the user is concerned, the compact, strong and simple nature of our panel, and the ease and certainty with which by its use any unskilled workman can operate the motor,

its perfect mechanical and electrical construction and the entire absence of fire risks are advantageous features possessed in their entirety by no other similar gear on the market, and therefore worthy of his closest consideration

MOTOR SWITCH-GEAR PANEL.

when comparing the 'Stellite' appliance with other makes. The prices are low consistent with the high-grade workmanship and materials employed throughout."

MESSRS. WILLIAM CUBITT & Co. have produced a catalogue of showcases, stands, &c. There are a large number taken from the examples which they constructed for the British Museum and the Natural History Museum. As they have been photographed in position the plates will suggest the variety of the contents of the two museums. As such the catalogue is a creditable production.

**DOULTON "GROUTED COMPOSITE" JOINT.**

UNLESS precautions are taken joints are the weakest part of most structures, for they cannot all be homogeneous, like immense castings. It is not therefore a peculiarity of drain pipes that, unless special methods are adopted, weakness should be exhibited in connecting them during laying. Two kinds of difficulties arise in attempting to make perfect joints in pipes. Objects of baked clay do

not lend themselves to the operations of workmen as readily as structures in timber or metal. It is also impossible to carry out the operations of jointing pipes as easily as can be accomplished with objects of another kind, when the operations can be performed in a workshop or with adequate space which enables the workmen to come in contact with all parts of the material. Trenches in which pipes are to be laid have to be narrow in order to save expense. They are often damp, and the work must

be carried out in weather however unfavourable. Under these circumstances efforts have been made to reduce the jointing to a sort of mechanical process which could be conducted under adverse circumstances and without any delicate manipulation. Messrs. Doulton have necessarily given much attention to the subject of connections, and their "self-adjusting joint" has been known and adopted in every country where care is given to drainage. In it rings of cheap and durable material are cast on the spigot and

not lend themselves to the operations of workmen as readily as structures in timber or metal. It is also impossible to carry out the operations of jointing pipes as easily as can be accomplished with objects of another kind, when the operations can be performed in a workshop or with adequate space which enables the workmen to come in contact with all parts of the material. Trenches in which pipes are to be laid have to be narrow in order to save expense. They are often damp, and the work must

socket, which fit mechanically when two pipes are put together, and it has formed unquestionably a most effective joint.

Messrs. Doulton do not believe in the French proverb that the best is the enemy of the good, and their self-adjusting joint in its turn has to submit to change. It continues to be as effectual as ever, and it will probably be never superseded. But assurance is made doubly sure by supplementing it with a joint of cement, which can be accomplished in

the trench after the two pipes have been fixed in position by the self-adjusting joint. The system employed in the patent "grouted composite" joint is remarkable for its simplicity and ingenuity. Let the reader imagine a line of stoneware pipes lying in a narrow trench and partially submerged in water. Suppose an official told the foreman that all the pipes were to be surrounded with a belt of cement as neatly executed as a wiped joint with lead pipes. The foreman would become at once dubious about the sanity of the

annular chamber formed by a band of canvas enclosing a space between the end of the socket of one pipe and a collar on the spigot of the adjoining pipe. The band is secured to the pipes by binding wires. An opening is left to allow Portland cement to be poured in between the canvas band or pouch and the surface of the pipe. The operation is simple and involves no unusual toil or trouble nor skill in the workmen, but a perfect ring of cement is formed which will last as long as the pipe. The bottom,

man who gave the order, for he would point out the utter impossibility of insuring that any man could introduce cement around the lower part of the pipe, and that all that could be guaranteed would be a sort of make-believe band which would be visible on the upper part alone. It would possess no sanitary advantage, but, on the contrary, would be injurious rather than otherwise. The self-adjusting joint undoubtedly forms an inner seal to the pipe. But an outer seal of cement gives additional security. In the "grouted composite" joint the grout is poured into an

which is not accessible unless with difficulty, becomes as securely sealed as any other part. The introduction of canvas may surprise theorists, but it should be remembered that canvas bags filled with cement or concrete are known in connection with hydraulic works, and therefore the material is not out of place in a drain. It is simply an envelope, and when the material decays there is no loss, for it has done its work. Although grouting has been attempted in pipe-laying, no method yet adopted is equal to that of Messrs. Doulton's on account of its simplicity

effectiveness, expedition in performance and perfection. A cement ring is formed which seals effectively the exterior of the pipe, and which is an additional guard against disturbance. Another advantage of the canvas envelope is that air and any excess of water in the grout can pass through it, and a perfect ring of cement is thus insured. The new joint has proved tight under an internal hydraulic pressure of 25 lbs. to the square inch. It may therefore be classed among the numerous triumphs of Messrs. Doulton in sanitary engineering.

### TIMBER IN LONDON HOUSES.

AN Act which was passed in 1774 has had an important influence on the building of London. The part relating to the use of timber was especially advantageous, for the careless employment of the material, which was for a long time passed over, was the cause of the destruction of a large amount of property by fire:—

Timber partitions between a building, and any building that was erected or begun to be erected before the passing of the Act, may remain till one of the adjoining houses is rebuilt, or till one of the fronts, or two-thirds of such fronts, which abut on such timber partition, is taken down to the bressummer or one pair of stairs floor and rebuilt.

No timber whatever is at any time hereafter to be laid into any party-arch other than for bond to the same. Nor into any party-wall other than for bond, &c., and the ends of the principal timbers to the floors and roof. But no timber bearer to wood stairs, where an old party-wall has been cut into for that purpose, must be laid nearer than  $8\frac{1}{2}$  inches to any chimney or flue whatever, or nearer than 4 inches to the internal finishing of the building adjoining. No timber to be laid in any oven, copper, stove, still, boiler or furnace, nor within 2 feet of the inside thereof.

No timber whatever to be laid nearer than 9 inches to the opening of any chimney, nor nearer than 5 inches to any flue of a chimney, oven, stove, copper, still, boiler or furnace, or nearer than 9 inches if such timber is placed nearer than 5 feet of the mouth of the same respectively. No timber to be laid under any hearth to a chimney nearer than 18 inches to the upper surface of such hearth. No

timber whatever to be laid nearer than 18 inches to any door of communication through party-walls between warehouses or stables. All woodwork whatever against any breast, back or flue of any chimney must be fixed by iron nails or holdfasts and not to be drove more than 3 inches into the wall or nearer than 4 inches to the inside of the opening of any chimney. Bressummers, storey-posts and plates thereto are only allowed in the ground storey, and may stand fair with the outside face of the wall, but to go no deeper than 2 inches into a party-wall, nor nearer than 7 inches to the centre of a party-wall where it is two bricks thick, nor nearer than  $4\frac{1}{2}$  inches if such party-wall does not exceed one brick and a half in thickness. All window-frames and door-frames to the first, second, third and fourth rate must be recessed in 4-inch reveals at least. Doorcases and doors, to warehouses only, as shall be of the first, second, third or fourth rate, may stand fair with the outward face of the wall. Every corner storey-post, which is fixed for the support of two fronts, must be of oak or stone, at least 12 inches square. No external decoration whatever to be of wood, except as follows:—Cornices or dressings to shop-windows, frontispieces to doorways, of the second, third and fourth rate; covered ways or porticoes to a building, but not to project before the original line of the houses in any street or way, and which covered ways or porticoes must be covered with stone, lead, copper, slate, tile or tin.

No covered way, or the cornice to any shop windows, nor the roof of any portico, is to be higher than the under side of the sill to the windows of the one pair of stairs floor. All other external decorations whatever to the first, second, third and fourth rate are to be of stone, brick, artificial stone, stucco, lead or iron.

Every flat gutter and roof, and every turret, dormer and lantern light or other erection placed on the flat or roof of any building of the first, second, third, fourth and also the fifth rate must be covered with glass, copper, lead, tin, slate, tile or artificial stone. No dripping eaves to be made next any public way, to any roof of the first, second, third or fourth rate, except from the roofs of porticoes or other entrances.

Wood trunks are not to be higher from the ground than to the tops of the windows of the ground storey; the pipes

from thence upwards must be of lead, copper, tin or iron, and may discharge the water into channel-stones on or below the surface of the ground. Or the wood trunks may be continued down below the surface of the ground into drains, &c., or into brick or stone funnels, and such funnels must in every part thereof be below the surface of the foot pavement.

### LONDON COUNTY COUNCIL SCHOOLS.

WORK is proceeding in connection with the erection of five new schools, the rebuilding of one school, the enlargement of five schools and the improvement of five schools, giving a total additional accommodation of 6,620 at an estimated cost of 171,654*l*. Two secondary schools are in course of erection, and a training college is being enlarged, giving a total additional accommodation of 1,348, at an estimated cost of 55,250*l*. Three technical institutes and a day training college are in course of erection, at a total estimated cost of 167,610*l*. Two manual training centres for forty boys each, and three special schools, giving a total accommodation for 260 children are being built; alterations are being made at an existing special school; a laundry and housewifery centre is being erected, and additional temporary special school accommodation is being provided at a total estimated cost of 18,842*l*. A scheme of sanitary improvement is being carried out at one school at an estimated cost of 2,658*l*. Redivision of rooms, enlargement of playgrounds and other minor improvements have been carried out at fifty-five schools, at an estimated cost of 9,641*l*.

Tenders have been accepted for cleaning or painting work at 104 schools, heating work at seven schools, the erection of iron staircases at one school, the erection of a house for the accommodation of the schoolkeeper of a secondary school, the enlargement of the playground of one school, sanitary improvements at a secondary school, alterations to the classrooms of an industrial school and the erection of lightning conductors at a day training college and a technical institute. The estimated cost of these works is 30,109*l*.

Contracts for repairs to heating apparatus, boiler setting,

repairs to the brickwork of boilers, repairs to school buildings in the Brixton county electoral division and tar paving have been terminated and new tenders have been invited for the work. Tenders have also been invited for cleaning the windows of Council schools throughout the county, and contractors are required to state therein the rates of wages proposed to be paid by them.

Alterations at four secondary schools, a day training college, a pupil-teacher centre, a school of art, a technical institute and a special school have been authorised, together with the adaptation of three buildings for secondary school purposes, and alterations and repairs at three schools. The total cost of these works is estimated at 3,016*l*. Expenditure amounting to 3,033*l* has been sanctioned for certain necessary minor improvements and repairs at various schools including heating work, painting and cleaning.

### LONDON COUNTY COUNCIL AND THE TWELVE-MILE RADIUS.

A STANDING order of the London County Council provides that the rates of wages and the hours of labour to be paid and observed by the Council in works which are in the nature of construction or manufacture, and which the Council may resolve to execute without the intervention of a contractor within a radius of twenty miles from Charing Cross, shall be the rates and hours set forth in the Council's list, which is based on the rates and hours recognised by associations of employers and trade unions and in practice obtained in London. The standing order also provides that contractors for works of the nature above-named shall be required to pay wages at rates not less, and to observe hours of labour not greater, than the rates and hours in the Council's list. The radius within which the standing order operates was fixed by the Council on December 16, 1892, when it framed the standing orders as to rates of wages and hours of labour which are with slight alteration now in operation.

On November 30, 1897, the Council, when revising the standing orders as to rates of wages and hours of labour, altered the radius from twenty to twelve miles, the altera-

tion being made as a result of representations made by the Institute of Builders and of objections raised before the special committee on the works department appointed in 1897, but on May 10, 1898, the Council decided to revert to the twenty-mile radius and this radius still obtains.

The working rule agreements between the London Master Builders' Association and the several metropolitan trade unions recognise the London area, within which such agreements are operative, as that within a radius of twelve miles from Charing Cross, and the Master Builders' Association have represented that the variation between the radius adopted by the Council and that jointly agreed to by the Builders' Association and the trade societies is calculated to cause friction between employers and workmen, and to breed discontent among workmen engaged by the same employer on works in close proximity to each other. They further point out that the application of London working rules to the larger area materially increases the cost to the Council of works situated between the two radii.

The general purposes committee consider that the area, with a radius of twelve miles, agreed upon between employers and workmen should be that within which the Council's list of rates of wages and hours of labour should apply, and it is recommended that "twelve" should be substituted for "twenty" in standing orders.

### LIVERPOOL DOCK WAREHOUSES.

It is only of comparatively recent date that attempts have been made in this country, says the *Liverpool Courier*, to employ the combination of metal and concrete in carrying out building operations on a large scale. The Mersey Docks and Harbour Board are adopting this system in connection with the new triple-storey shed or warehouse now being erected on the south quay of the Sandon Dock. This shed is intended for the accommodation of general produce. The general dimensions are—greatest length 630 feet, breadth 94 feet and height 56 feet. The work is now in an advanced state, and by the courtesy of the Dock Board and their engineer-in-chief (Mr. A. G. Lyster) the members of the Liverpool Engineering Society were enabled to inspect the

building last week. They were received by the Dock Board's resident engineer (Mr. R. W. Knollys), who conducted the party over the huge premises and explained the technical details, which proved of great interest to the members. In the building of the walls, columns, floors, staircases, &c., reinforced concrete is being used, that is, Portland cement concrete with steel rods and bands embedded therein.

The largest columns have each twelve steel rods of  $1\frac{3}{4}$ -inch diameter, and measure 21 inches by 24 inches. The largest beam has a 47 feet span containing twelve bars, eight of which are 2 inches diameter and four of  $1\frac{3}{4}$ -inch diameter. In the higher portions of the buildings there are beams with nine rods, six of which are  $2\frac{1}{4}$  inches diameter and three of 2 inches diameter. The foundations are on piles also composed of ferro-concrete. The area of the ground floor is about 5,400 square yards, whilst the upper floors, of which there are two, have an area of about 6,600 square yards. The roof is practically flat, and is constructed of the same materials as the rest of the building. It is anticipated that the work of erection will be completed early next year. The visit proved of undoubted interest to those engineers who were fortunate enough to be present, and it was felt that the Dock Board were to be congratulated upon the highly successful results obtained with this somewhat novel style of building, which will undoubtedly prove of great advantage to the port and ship-owners when brought into use.

THE amended plans of the new bridge to be erected over the roadway at Tynecastle have been approved by the streets and buildings committee of Edinburgh Town Council. The probable cost will now be increased from 4,500*l.* to 5,000*l.*, but the erection of the bridge will be delayed till after next year's exhibition.

A SCHEME prepared by the Salford borough engineer for constructing a relief sewer and storm-water overflow from the Dock Road, near the Weaste Cemetery, to Liverpool Street, opposite the recreation ground, at an estimated cost of 25,218*l.*, for the purpose of relieving the flooding in the Weaste district, is under the consideration of the Salford highway and paving committee.

## TRADE NOTES.

WE have received from Messrs. Pinchin, Johnson & Co., of Minerva House, Bevis Marks, E.C., some show-cards relating to their Satinette and Minerva paints. They are beautifully reproduced. The one in connection with Satinette, the well-known white enamel, illustrates in colours the latest Cunard boat, the *Mauretania*, where Satinette was used exclusively. Copies may be obtained by any of our readers on application.

MESSRS. D. G. SOMERVILLE & Co., of 72 Victoria Street, S.W., have secured the contract for supplying and erecting the steel framing and forming reinforced concrete roofing to workshops for the new electricity works at Hendon.

MESSRS. WARING & GILLOW's place in Oxford Street was beautifully decorated for the procession of their Majesties the Emperor and Empress of Germany. The imitation stone columns, bases and cornices were effectively treated with Coatstone, giving quite the effect of a stone construction and showing admirably how the material will undoubtedly become popular for the purposes of street and exhibition decoration.

OWING to the retirement of Mr. George Wragge, of the firm of George Wragge, Ltd., Messrs. Samuel Humphries, James Jackson and J. Finlayson Ambler have formed a new company at Brook House Works, Manchester. Among their specialties are casements with special opening gear, decorative metalwork, gas and electric fittings, steel door furniture, &c. From their training under Mr. George Wragge and their experience in co-operating with him, they are in a position to carry out his principles faithfully in all departments of the business.

ANOTHER variety of reinforced concrete, known as the Herbst Armocrete, has been tested by the British Fire Prevention Committee. Two of the beams were 14 feet span and one 28 feet. The concrete webs were L-shaped, and embedded in each was a wrought-iron corrugated bar. Hollow concrete tubes were made to correspond with the rebate on the webs. One slab, 14-foot span, was loaded with over 12 cwt. per square foot before it broke in the centre. The 28-foot slab was loaded with 7½ cwt. per super foot before cracks were visible, and the third slab of 14 feet, 6½ cwt. per foot super before it broke in the centre. The results were remarkable.

UNDER the direction of Mr. J. E. Swindlehurst, city engineer, the "Boyle" natural system of ventilation, embracing the latest patent air-pump ventilators, has been applied to the School of Art, Coventry.

MESSRS. JOYCE & Co., of Whitchurch, Salop, have just completed the fixing of a clock and bell at Tarporley, Cheshire, for the Hon. Marshall Brooks. The same firm are making a striking clock for Greenbank school, Sefton Park, Liverpool; and also one for Lamport Hall, Northampton, the residence of Lord Ludlow, and are also fixing a bracket clock with two dials in Oxford Street, London.

TRAVELLERS on the main line of the North-Eastern Railway to the north will have noticed a pretty church near the railway just before entering Gateshead and Newcastle: this was rebuilt in 1758 and the tower in 1821, and a chancel was added afterwards by the first Earl of Ravensworth. Now a new clock with two new external dials, chimes and bells have been added by the Countess of Mount Edgumbe as a memorial to the late Earl of Ravensworth, the work having been carried out by Messrs. Wm. Potts & Sons, Ltd., of Leeds and Newcastle-on-Tyne, generally on the lines laid down by the late Lord Grimthorpe. Messrs. Potts are also fixing a new large clock at Dover for H.M. Government.

ALL SAINTS CHURCH, Lower Sydenham, was consecrated by the Bishop of Woolwich on Thursday, Nov. 7. The chancel, vestry, transepts and three bays of the nave were completed and dedicated for use some four years ago, since which time many additions of suitable fittings have been made, and the debt on the building fund practically paid off, and it is the intention of the committee to proceed with the completion of the church as soon as funds will allow. The church, when completed, will be large and lofty, with accommodation for about 850 adults. The materials used are red and stock bricks with dressings of Box ground stone. One of the main features of the interior is the stone traceried screen, carried to the full height of the chancel arch, a large rood-cross being formed in the stone tracery, and spaces for the addition of figures on either side. The architect is Mr. Geo. H. Fellowes Prynne, F.R.I.B.A., of 6 Queen Anne's Gate, Westminster, and the builders are Messrs. Goddard & Sons, of Farnham.

Fig. 1528.—The "KORRIS" (Regd. Trade Mark).

## URINAL RANGES

DESIGNED AND MANUFACTURED BY  
THE LEEDS FIRECLAY CO., LTD.,  
ARE CHARACTERISED BY

- (1) The minimum number of joints, thus reducing liability to leakage.
- (2) The rounding of all internal angles, thus allowing no part to become foul.
- (3) Easy accessibility to all parts.
- (4) The open channels admitting of easy cleaning.
- (5) Hardness and strength of the burnt material.
- (6) Highly glazed impervious surface.

## BUILDING AND BUILDERS.

Nos. 20, 21, 22 and 23, Holborn, which include the old Barnard's Inn tavern, and also the entrance to the Mercers' Company's School, are to be demolished immediately, and an imposing building, seven storeys high, and of a very ornate character, is to be erected thereon under the direction of Messrs. Palgrave & Co., architects, Westminster, S.W. The scheme provides for a restaurant, shops and offices above, approached by electric lifts. Provision is to be made under the terms of the lease, which is held from the Mercers' Company, that a new entrance to the school is to be provided under the new frontage, eight feet wide, while the license of the Barnard's Inn tavern is surrendered. The quantities are being prepared by Messrs. Westropp, Sweetnam & Co., Parliament Chambers, Westminster, S.W. A block of business premises consisting of five shops, with dwellings above, is to be erected at the corner of Uxbridge Road and Ormiston Road, Shepherd's Bush, W. Mr. H. F. Webb, of Spencer Street, Goswell Road, E.C., is the contractor whose tender has been accepted; Messrs. Palgrave & Co., are the architects, with Mr. J. Farrell as quantity surveyor.

THE litigation between the Lancaster Rural District Council and Messrs. Fisher & Le Fanu, contractors for a large portion of the second line of pipes for the Manchester water supply from Thirlmere, has ended. The Council sued the contractors for damages to the highways in the townships of Ellel and Wyresdale, and at Liverpool Assizes were awarded 500*l.*, it being contended that the roads required remaking because of the holes the traction engines had made in hauling pipes. The contractors appealed against the verdict and the appeal was allowed. Surveyors were appointed to estimate the proportionate damage caused to the road, and have now agreed to the sum of 175*l.* being paid to the District Council, instead of 500*l.*

THE estates committee of the Sheffield City Council have considered letters from the builders of the model cottages at Wincobank, with reference to the proposal of the Corporation to take possession of the cottages on November 1, and to pay interest at the rate of 4 per cent. on the agreed purchase money from that date until the completion of the purchase. Most of the owners accepted

the proposal, but some of them asked for interest at the rate of 5 per cent. instead of 4 per cent., which they stated is less than they are paying for borrowed money. The committee have agreed to pay 5 instead of 4 per cent., as previously recommended. The city treasurer has been instructed to take steps to forthwith let the cottages.

AN interlocutor has been issued in an appeal to Sheriff Ferguson in an insurance case by Charles Johnston, contractor, Lochee, against James Fettes, insurance agent, Dundee. Plaintiff sought to recover 200*l.*, being the loss which he had sustained through defendant having failed to properly insure his workmen. He pleaded that defendant had for years been entrusted with effecting all his insurances, and that in 1900 he called upon him to insure him against liability for injury to his workmen, and more particularly while they were removing stones and excavating. Two of his workmen were injured while excavating and defendant repudiated the insurance claims. Defendant averred that plaintiff agreed to insure his carters and labourers only, and refused to take out a policy for quarry risks. The sheriff sustained the appeal by defendant and dismissed the action, and found the plaintiff liable in expenses. Any claim by the plaintiff was, he said, out of the question in view of the acceptance of the policy, which was clearly expressed.

A MEETING of the Council of the National Association of Master House Painters and Decorators of England and Wales (Incorporated) was held on Tuesday at the Acorn Hotel, Birmingham. Mr. G. H. Morton (Liverpool), the retiring president, occupied the chair at the commencement of the proceedings. Statements of accounts were presented which showed that after the payment of all accounts there remained a balance in the bank of 200*l.* Mr. Morton retired from the office of president, and transferred the chain of office to the newly-elected president, Mr. A. J. Teall (Birmingham). It was decided to hold the next annual convention in Birmingham from September 29 next to October 3, and also that the exhibition in connection with the convention be held in Bingley Hall. It was further decided that the next meeting of the Council should be held at Newcastle-on-Tyne on February 6.

## VARIETIES.

ADJOINING the new county hall at Northallerton it is proposed to erect for the North Riding new police offices.

MESSRS. W. J. MORLEY & SON, architects, of 269 Swan Arcade, Bradford, have taken Mr. Eric Morley into partnership, and the firm will be carried on as W. J. Morley & Sons in future.

THE Auckland City Council has accepted the tender of Billington & Co. at 29,112*l.* for the big impounding dam at Waitakerei Falls. This was the lowest tender. The engineer's estimate was 34,537*l.*

THERE has just been completed and erected over the main entrance to the municipal buildings, Bank Street, Alloa, a very handsome piece of sculptural work representing the new coat-of-arms of the burgh, recently gifted to the Town Council by the Earl of Mar and Kellie.

DURING the past few years Bacup has spent 34,409*l.* in erecting new and altering existing day schools, and last year 5,500*l.* was contributed from the rates. This year the amount will be 6,000*l.*, and another new school will have to be built for Weir district at a probable cost of 6,000*l.*

AT a meeting of Port Glasgow School Board held last week, it was agreed to build a new elementary, higher grade and supplementary course school on the lands of Highholm, at a cost of 14,200*l.*, capable of accommodating 900 scholars.

THE Birmingham Tame and Rea District Drainage Board have been informed by their finance committee that the Local Government Board had sanctioned the application of the Board to borrow 45,000*l.* for the construction of bacteria beds, &c., at Minworth Greaves, and 1,908*l.* for the extension of the sludge conveying scheme, the money to be repaid within thirty years.

MR. F. J. WHITEAR has been appointed highway surveyor to the Fareham Rural District Council. For the post there were 160 applications, and of these six were sent forward by a special committee for final decision by the Board. There was a tie between Mr. Harvey, of Gosport, and Mr. F. J. Whitear, assistant surveyor at Alton, and the chairman gave his casting vote in favour of the latter.

THE opening of the Congregational church at Ashwell, Herts, took place on Thursday, November 14. The building has been entirely remodelled and redecorated and new oak seating, &c., introduced. The work has been carried out by Mr. F. J. Bailey, of Ashwell, from the designs and under the superintendence of Messrs. Geo. Baines & Son, 5 Clement's Inn, Strand, W.C.

A BAPTIST church in High Street, Ilford, was opened on Wednesday, November 13. The cost of erection is nearly 5,500*l.* The design is in Late Gothic. The church accommodates about 950 persons. A large institute and school is to be at once erected on the same site. The architects for the scheme are Messrs. Geo. Baines & Son, of 5 Clement's Inn, Strand, W.C., whose designs were selected in competition. The contractors are Messrs. Kerridge & Shaw, Sturton Street, Cambridge.

THE picturesque Scottish mansion known as Calderwood Castle in the West of Scotland and the large estate were purchased in 1904 by the Scottish Co-operative Wholesale Society, Ltd., for 37,500*l.* The fittings appear to have been specially designed, and a most elaborate firegrate and fender is now on view in the spacious show-rooms of Alexander Ritchie & Co., 12 and 13 Upper Thames Street, E.C. It is deserving of a visit as a survival of a time when the applicability of Gothic forms was supposed to be unlimited. There is much besides in the galleries worthy of attention.

ASPINALL'S ENAMEL, LTD. NEW CROSS, LONDON, S.E.

AN admirably-written and well-illustrated article on quaint, old-time "Charleston," by Charles H. White, appears in the current issue of *Harper's Monthly Magazine*, which also contains, among much other readable matter, an interesting account of "A Plantation in the African Hills," or the districts round ancient Carthage, including Medjes-el-Bab, which is literally covered with crumbling attestations to the supremacy of the Cæsars—cisterns, baths, triumphal arches and mausoleums.

THE British Mannesmann Tube Company, Landore, has applied to the Swansea Corporation for a supply of electric current, and the question will be discussed at the next meeting of the electricity committee. Other owners of big works are understood to be contemplating a similar course, and a proposal is therefore to be considered for extending the present electricity works at a cost of 30,000*l.* or of constructing subsidiary works nearer to the industrial localities.

THE St. Pancras Borough Council is carrying out a much-needed scheme for the housing of the working-classes, which includes erection of a large block of dwellings in Brantome Place, off Euston Road. The area was cleared some years ago, and the small property with which it was formerly covered will now be replaced by buildings of the most approved type. The buildings are designed to contain forty-eight three-room tenements and thirty-six two-room tenements, affording altogether accommodation for about 432 persons. It is estimated that the dwellings, of which the foundation-stone has been laid, exclusive of the site, will cost 22,000*l.*, and the rents will be so adjusted as to make the undertaking self-supporting.

A RETURN issued from the Treasury in response to a motion in the House of Commons by Sir Howard Vincent shows that Government contracts amounting to 519,000*l.* went abroad in the course of the last financial year, either direct or through contractors who obtained the required articles from foreign countries. It is difficult to see why many of the articles enumerated should not have been made at home. The War Office, for instance, spent 1,924*l.* on foreign horseshoes and nails, and smaller sums on such things as practice swords, a cycle ambulance, stoves, lamps, and so on; whilst the Office of Works imported a lawn-

mower, gas fittings and globes, paint, door springs, ironmongery, locks and keys and bentwood chairs.

A MEETING of the governors of the Cumberland infirmary held at Carlisle last week approved a scheme for the extension of the institution at a cost of 25,000*l.* The committee of management have adopted plans which provide for the erection of a new west pavilion, containing on the ground floor a new ward for twelve men and on the first floor a new children's ward with twenty-four cots. It is also proposed to build a kitchen block, to remodel the laundry and fit with modern steam-worked machinery, to reorganise the heating and hot-water services, to add a storey to the nurses' home, to enlarge the out-patient department, erect ophthalmic and X-rays departments, and provide better facilities for the treatment of casualties and to make structural alterations in the central block.

At the last meeting of Paisley Dean of Guild Court Dean of Guild M'Naughton stated that during the past year seventy-seven applications for linings had been brought before the court as against seventy-nine in the previous year. The total value of the property in question amounted to 118,420*l.*, an increase of 3,110*l.* as compared with 1906. Amongst the properties passed were ten four-storey tenements, four three-storey tenements, seven villas and thirty-six semi-detached villas, halls, &c., the remainder of the applications being made up of alterations and additions. Permissions were also granted in twenty-one minor cases by the master of works in virtue of the powers conferred upon him by the Paisley Police Act, 1901.

THE Local Government Board have sent a letter to the town clerk of Coventry on the subject of a loan for the shops, part of the municipal building scheme in Earl Street, which has been the subject of controversy for some time past. The Local Government Board were asked to state definitely whether they would sanction a loan for such a purpose. The answer now to hand is that "it is the Board's intention to exclude from any loan they may find themselves able to sanction, on being furnished with the further particulars asked for in their letter of September 2, the estimated cost of adapting the ground floor of the proposed buildings for shops." The inference drawn is that shops, if erected, will have to be paid for out of current rate.

6 Argyll Street, Regent Street  
LONDON, W.

THE question of electric lighting for Dunfermline was revived at the last meeting of the Town Council. A committee that was appointed several months ago recommended that, looking to the diversity of opinion in the Council on the different schemes proposed and the large amount of capital expense involved, Professor Sir Alexander Kennedy, Edinburgh, the adviser of the Edinburgh Corporation on electric lighting, be asked to report to the Council on the following questions :—Whether the Council should establish a separate generating station, take a bulk supply from the City Electric Power Company, transfer the provisional order to that company, or allow the order to drop? This recommendation was adopted last week by a majority of the vote.

MR. W. S. WILSON, engineer for the carrying-out of the preservative works on Ayr Auld Brig, has sent in the following report, dated November 8, on the work being done on the bridge :—"The pointing of the fourth arch was completed at the end of September, and six masons were then paid off. A portion of the underpinning of pier No. 1 has been done, and, having ascertained the difficulties to be contended with, I expect that this part of the work will go on more rapidly. During the heavy floods of last month a good deal of water reached the works, and [a 4-inch centrifugal pump had to be fitted up. So far as opened up, the ground below No. 1 pier consists of very hard boulder clay, and this makes an excellent foundation for the underpinning. The concrete floor and sump of pier No. 2 have been finished, and when the necessary pump has been provided underpinning operations will be started here also. Owing to the restricted nature of the work, only twelve men are employed at present. The expenditure to this date is £180l.

It is understood that a start will be made with the newaval base at Rosyth early in the new year, and that an initial sum of one million will be allowed for the work in the new Estimates. Sir John Jackson, Ltd., have received instructions to sink the trial concrete cylinder caisson 50 feet deeper than it has now reached, viz. 72 feet, for the purpose of proving the depth of the stratum of boulder clay which was met at about 60 feet below present surface level. The whole of the water has been pumped out of the

caisson to allow the additional sinking operations to be begun at once. It has been decided to proceed with constructional work on the cement-concrete monolith principle, the intention meantime being to proceed with a sea wall, a wet basin and graving dock. A bore has just been sunk on the shore to test the depth of sand, and here will be quarried the sand necessary to mix with the whinstone, which also abounds here, in the formation of concrete blocks.

AFTER a long controversy concerning the restoration of the Dundee city kirks, the Kirk Session and Presbytery approved of the offer of the Town Council to execute the work, according to plan, at a cost of 4,500l., the Corporation to carry it out by their own workmen. It is against this latter proposal that the master-builders protest. They have lodged a memorial and asked to be heard before the Town Council comes to a final conclusion on the matter. The master-builders contend that a slur has been put upon them and upon their skill as tradesmen. Further, it is urged that, as the building trade of the city is not particularly brisk, they and their men should get a chance. Another point on which the Association lays insistence is that it is not in the interest of the community that the work should be executed by Corporation employ  s, inasmuch as operations so conducted cost fully 20 per cent. more than if fulfilled by contract.

THE town clerk of Scarborough has received the award of Sir William Matthew, the engineer, with respect to the damage to the sea wall caused by the tidal wave of January 1905 and storms since that period. The award is as follows :—"I hereby certify that I have inspected the works which, under Clause 2 of my award, I determined that the contractor was bound to execute in order to fulfil his obligations as therein mentioned, and I certify that such works have been carried out to my satisfaction." This award virtually settles the contention between the Scarborough Corporation and the contractor. The professional adviser to the Corporation, Mr. James Walker, of Newcastle, recently inspected the wall on their behalf, and specified certain work which he considered should yet be done by the contractor under the maintenance clause in the contract, but it is of a comparatively unimportant character and no

difficulty will be caused in that respect. There is now every prospect that the long-delayed completion of the works will speedily be witnessed, and that the important undertaking will be formally opened early next season.

ACCORDING to the reports for last year of H.M. Inspectors of Mines, at the 2,783 mines in England and Wales there were 831 coal-cutting machines in use which mined 7,169,823 tons. In the 512 Scottish mines the 305 machines cut out 3,032,683 tons of coal. As regards motive-power, so much has been heard in recent years of the rapid strides made by electricity that many would regard this power as paramount. In England and Wales it certainly is not, for there 551 machines have compressed air as their driving power as against 280 only using electricity. In the mines of Scotland, however, the balance does favour electricity, but it is not considerable, being only 171 to 134 working by compressed air. When the electrical machines are better adapted for use in mines this power may displace compressed air. Mr. A. H. Stokes, H.M.I.M. for the Midland inspection district, has declared that the method of driving the coal-cutter by electricity appears to be not only the cheaper, but the easiest of application, an objection to compressed air being the noise, preventing the men from hearing any subsidence or breaking of the roof or timber. The

In the annual public lands report for the colony of Queensland particulars of the forest department are given. In Queensland there are 337 timber reserves, comprising 3,460,826 acres, and fresh reserves are being constantly declared. The Director of Forests points to the necessity of increasing these national supplies of timber, and states that 26 per cent. of the whole of Germany is devoted to forests, producing a yearly yield of 9,000,000,000 superficial feet; in France 20 per cent. of the whole country is forest area. In India the Government are compelled to scour the world for railway sleepers, notwithstanding a forest outturn of 3,018,819,312 feet of timber. The consumption of forests all over Australia is very large, and Queensland is no exception. Last year 82,800,000 superficial feet of manufactured timber was cut in the colony; soft woods, 49,588,575 feet; hard woods, 32,364,046 feet; and cedar, 849,001 feet. A motion was carried in Parliament some years ago recommending the replanting of the forests and the appointment of a Department of Forestry. Queensland

has been a great supplier of sleepers to India; in 1906 sent 25,000*l.* worth of sleepers to that country.

THE Rhyl Council spent several hours on Monday discussing the details of an improvement scheme which is proposed to carry out on the sea front. While all members were in favour of a pavilion being erected which high-class concerts can be given in the season, there were three members who opposed the ornamental garden scheme, but by twelve votes to three the Council decided to go in for the two schemes. It was stated that 3½ acres of foreshore between Edward Henry Street and Queen Street will be enclosed as marine and ornamental gardens. There will be a row of double shelters. The side will be open to the sea, with plate-glass backs, and the other side will open to the enclosed gardens. It is contemplated that 10,000*l.* will be spent on the pavilion and 4,000*l.* on the gardens. Sketch plans and suggestions are to be laid before the Council on Monday next by several architects.

### LIVERPOOL CATHEDRAL.

On Monday there was a monthly meeting of the Liverpool Cathedral committee. Sir William Forwood presided. On the proposition of the chairman, a vote of condolence was passed with the family of the late Mr. G. Bodley, the joint architect of the cathedral. A resolution was afterwards adopted investing Mr. Gilbert Scott with full power to act for the future in the construction of the cathedral, but reserving to the committee the right at any time to appoint a joint architect if at any period it became advisable in their opinion to do so.

The treasurer reported that there was at the present time a sum of 165,000*l.* in hand, this amount including a donation of 10,000*l.* given anonymously since the last meeting of the committee. It was stated that the sum of 40,000*l.* had so far been contributed by the children of the diocese. The total amount up to date which has been received and promised is 283,000*l.*

The clerk of the works reported that the building was being proceeded with most satisfactorily, 220 men being present employed on the site.

**SOCIETY OF ENGINEERS.**

A PAPER ON Bridle Roads in the West Indies, by H. C. Huggins, was read at the meeting on Monday, November 4. The author first referred to the old abandoned hillside road tracings in the island of Tobago, B.W.I., as originally laid out by former French military engineers, and their conversion now into economical natural soil bridle roads to meet the present growing demands for the opening up and developing the country. Respective road sections were then discussed in the re-forming of these traces and cutting into the solid banks shown to be the most satisfactory and economical method to be eventually employed. The value of banking to form parapets and the advantage of dispensing with side drains on this class of road were alluded to. Reference was made to the many streams which intercept these roads and the method of dealing with them; also the building of retaining walls for larger streams to avoid inundation, and the method of erecting them suitable for subsequent conversion into culverts was dealt with. The felling of forest trees was next referred to. The effects of over-felling and the advantages to be derived from the moderate use of the axe were considered. Suggested clearings for permanent bridle roads and those to be converted into cart roads in the near future were made. The frequent occurrence of road slips during the rainy season on these roads in a country of this nature was noted and the importance of carefully locating the lowest point of subsidence was dwelt upon. The author gave a description of a landslip where, owing to sea encroachment and other causes, a portion of the whole roadway subsided, danger to building being involved. The mode of repairing the slip by means of a surcharged retaining wall at the base of the cliff was explained and the method adopted for the final restoration of the roadway was illustrated. Attention was directed to river encroachments and the diversion of watercourses by means of temporary groynes, and practical suggestions were made as to the relative positions of such structures to effect the required result. Bridle bridges were discussed and the necessity of regulating their design in accordance with future development of the roads was

insisted on. Finally, the author's method of utilising steel rails in the construction of bridle bridges was described in detail.

**THE SESAME DOORS.**

ONE of the principal novelties at the International Building Trades Exhibition was undoubtedly the exhibit of the Carey's Sesame doors. Since that time they have been introduced into a number of buildings, and in every case are understood to have given complete satisfaction. The illustration shows the doors which have been fitted up at

Messrs. Story & Triggs's premises in Queen Victoria Street, E.C. The doors open automatically on the approach of any person and close immediately on passing through. The mechanism required is very little, as only 8 inches space has to be cut away, and it is therefore possible to fix them in almost any building. The makers are Messrs. Pemberton, Arber & Co., of Gray's Inn Passage, W.C.

**LEICESTERSHIRE AND RUTLAND ASYLUM.**

THE new Leicestershire and Rutland county lunatic asylum at Narborough was opened recently. The estate has an area of over 186 acres.

The main asylum buildings are placed on an excellent plateau on high ground, occupying the northern portion of the land, from which good views of the surrounding country are obtained. The aspect of the wards generally is to the south-east, every patient's day-room being so planned that it will, during some portion of the day, receive direct sunlight.

Provision is made for separating the male and female patients respectively into six classes on the male side and eight classes on the female side, and this permits of sick, infirm, recent, acute, epileptic and chronic patients being treated in wards set apart for the special treatment of the various forms of insanity from which they may be suffering. No wards (with the exception of the charity blocks) are arranged for a less number of patients than thirty-six. This is done in order to facilitate the economical working of the asylum, as every ward must have not less than three attendants.

All the wards are arranged in buildings of two storeys in height only. Formerly three-storey buildings, which are cheaper, were allowed by the Lunacy Commissioners for all classes of lunatics, but in recent times they have not sanctioned three-storey wards excepting for quiet chronic patients. All the day sleeping space required for the patients lodged in each ward is provided on the same floor.

The sick and infirm wards, male and female, each accommodate forty-six patients on the ground floor and forty-six patients on the first floor, and occupy the central positions adjoining the assistant medical officer's quarters and near to those of the matron and head attendant. These four wards each consist of a dormitory for twelve beds, a dormitory for twenty-four beds, ten single rooms, three day-rooms, together with the necessary attendants' rooms, store-rooms, ward scullery, bath-rooms, clothes lobbies, lavatories and other sanitary arrangements. There are also special recent and acute wards and epileptic and chronic wards for male and female patients.

The outlying blocks on each side of the main buildings

connected by corridors at an oblique angle are each for the reception of thirty charity and private patients. The arrangements on both sides are quite similar, and consist of two large day-rooms, three single rooms, three attendants' rooms, a ward scullery, pantry, store-room, visiting-room, lavatory and w.c. accommodation, also a wide corridor, which it is intended to use for dining purposes, all on the ground floor. The first floor is occupied by two dormitories, each for ten beds, seven single rooms, bath-room and other sanitary arrangements. The wide corridor on this floor contain all the wardrobes for patients' clothing, in order that they may not readily obtain materials for suicide. The arrangement has also the advantage of reducing the quantity of furniture in the sleeping-rooms, which, for a variety of reasons, is a very desirable thing to do. The accommodation provided in the charity blocks is of a more spacious character, and the fittings are rather better than those of the ordinary wards.

The first floor over the entrance block is occupied by the nurses' bedrooms and sitting-rooms, a separate bedroom being provided for every nurse. This is considered a wise provision, because of the complaints that are made in many other asylums by the nurses against associated bedrooms. This block is approached by a staircase entered from the corridor on the female side, a second escape staircase being placed at the opposite end of the building, giving access to the garden court, which also has a door into the same corridor.

A recreation hall of ample size is planned to the south of the kitchen, between which apartment and the hall there is placed the hall scullery, which is provided in accordance with the wishes of the Lunacy Commissioners in case the hall should be used as a general dining-room for the patients. At one end is a gallery for visitors, and at the other a spacious stage with dressing-rooms adjoining. The recreation hall has two entrances from each side for the patients. For stage entertainments one-half of the hall will be set apart for females and the other half for males, each sex being able to approach their seats without crossing the portion of the hall allocated to the opposite sex.

On the west side of the administration buildings the male attendants' block is situated. On the ground floor a large day-room, a dining-room, the head attendant's office,

a scullery, an officers' dining-room, and necessary lavatory accommodation is provided. The first floor is occupied by bedroom accommodation, proper bath-rooms and other sanitary arrangements, also a box-room being placed in convenient positions. It should here again be pointed out that the comforts proposed for the attendants are much greater than was thought sufficient in days gone by.

On the east side in a corresponding position to that just described for the male attendants the nurses' block is located. The accommodation on the ground floor is similar to but slightly larger than that provided for the male attendants, in consequence of there being a greater number of nurses than male attendants.

The chapel, with seating accommodation for about 100, is a detached building, easy of access from both the male and female sides of the asylum. It contains no special features except distinct entrances for each sex. A small closed porch or lobby is placed on each side of the entrances, so which epileptic patients seized by fits during service may be removed.

The buildings are erected entirely in brickwork, with a very sparing use of stone for window sills and other special dressings.

Fire-resisting staircases of shallow risers and without winders or long straight flights, are placed in the best positions for providing at least two exits from every ward in case of fire, and for giving access from all the wards to the recreation hall, chapel, workshops or airing courts without passing through other wards. All the ceilings next below the roof in all parts of the asylum occupied by patients are constructed throughout of incombustible materials in accordance with the Lunacy Commissioners' requirements.

The internal walls of kitchens, ward sculleries, sculleries, larders, laundries, engine-houses, water-closets, bath-rooms, dry linen and slop-rooms and lavatories are in some cases to be wholly faced with glazed brickwork and in other cases with glazed tiles up to dado height. The workshops are lined internally with common brickwork fair pointed. The whole of the remaining internal wall facing is done in cement and plaster, some of the walls and ceilings to single courses for dirty cases being faced with polished cement over.

In accordance with the requirements of the Lunacy Commissioners the administrative departments are all made larger than the present number of patients call for. The new buildings at present provide accommodation for 688 patients, and the plans are sanctioned for a complete asylum accommodating 912 patients, exclusive of hospital block and any villas which may be hereafter erected for special purposes. This matter was fully considered by the committee, who, after taking into consideration the increasing number of lunatics, agreed with the Lunacy Commissioners, who deem it would be unwise to provide for a smaller extension than this. Including land and furnishing the cost is 261,000*l*.

The architects are Messrs. Everard, Son & Pick, of Leicester. The main contract for the asylum buildings, medical superintendent's house, church, isolation hospital, entrance lodge, stables, head attendant's house, attendants' cottages, roads, cold-water mains, drainage, was entrusted to Messrs. W. Moss & Sons, Ltd., Loughborough. The sanitary fittings were by Messrs. Doulton & Co.; the laundry machinery and fittings by Messrs. Summerscales & Sons. The architects' clerk of works was Mr. George Wise.

#### IMPROVEMENT OF PORT OF LONDON.

In July it was reported by the rivers committee of the London County Council that they thought it desirable that members of the committee should visit some of the principal ports on the Continent, in view of the probability of the Port of London being the subject of a Bill in the next session of Parliament. When, however, the matter came before the Council, objection was taken to the proposal that expenditure should be authorised to meet the travelling expenses of members, and the recommendation was lost on a division. Accordingly they resolved that the visit should be made by the members at their own cost, and the only expenditure to which the Council has been put has been the small sum necessary for the expenses of the officers accompanying the committee.

It is somewhat remarkable that, though the great question of the Port of London has been the subject of inquiries and resolutions on the part of the Council during the past

where the "Drawwell" can be seen in action.

ten years, culminating in the introduction by the Council itself of a Bill dealing with the matter, no personal investigation by members of the Council into the actual conditions prevailing at other ports has ever been previously undertaken. The committee think, therefore, the Council will agree that the time had arrived for such an investigation.

They have inspected the docks in the Port of London, and paid visits to the following ports:—Manchester, Liverpool, Southampton, Cardiff, Barry, Bristol, Avonmouth, Antwerp, Rotterdam, Bremen, Bremerhaven and Hamburg. The object of the visits was twofold—in the first place, to obtain directly the latest information; and in the second place, to be in a position to present that information in a compact form, so that members of the Council generally might be able to appreciate the importance of the subject so far as London is concerned, and draw, it may be, some useful deductions and comparisons. The committee say:—We were particularly impressed by the very extensive improvements which had recently been, or were being effected at all the ports visited. At Antwerp, for instance, a great scheme of dock development has been sanctioned and is in progress, which is estimated ultimately to cost about 12,000,000*l.* This is exclusive of what is known as the Grand Coupure, and is, of course, in addition to the large extensions which have taken place during recent years both in dock and river quay accommodation. At Rotterdam, besides great improvements to the waterway, a large new dock has been recently completed, and an extensive area of land acquired for further developments, which are proceeding. Great improvements have been effected both in the river and docks at Bremen and Bremerhaven, while at the latter port it is intended to construct at a cost of some 2½ millions two new docks capable of accommodating the largest vessels, as well as a large graving dock. At Hamburg also very extensive improvements have recently been effected, the river channel having been dredged to a depth of 26 feet at low water, and new or improved docks having been provided.

In the British ports visited it was also found that considerable developments were in progress or had been recently completed. The Mersey Docks and Harbour Board has this year obtained authority to expend a further sum of about 4,000,000*l.* in new docks. At Southampton,

Cardiff and Avonmouth large new docks are in process of construction, while the docks at Manchester and Barry have only recently been completed, and the expenditure on new works at these five ports has not been less than 10,000,000*l.*

In London the only development of any consequence which has taken place during the last ten years is the construction of the new Greenland dock by the Surrey Commercial Dock Company, at a cost, including equipment, of about 1,400,000*l.* As is well known, the London and India Docks Company have for some years proposed to effect a large extension of the Royal Albert Docks at a cost of about 2,000,000*l.*, and they have recently bought land for this extension at a cost of about 130,000*l.* This proposal is, however, in abeyance, owing to the unsettled state of the Port problem.

The general deductions which we have drawn as the result of our visits may conveniently be summarised as follows:—

1. That extraordinary rapid and extensive improvements in accommodation and equipment are taking place, and have recently taken place in all the ports visited, and that no effort is being spared both to attract business and to anticipate growing requirements, and that, although it is true that since 1886 the tonnage of shipping entering the Port of London annually has increased from 12 to 17½ million tons, and while this increase appears fairly to keep pace with that of the principal British and continental ports, yet there is good reason to fear that the rate of increase in London shipping must be retarded unless prompt measures are taken to provide additional and up-to-date accommodation.
2. That a general comparison between London and the continental ports visited is rendered difficult by the fact that in all those ports the docks and quays lie close to the centre of the city, and are not scattered, as in London, over a wide area extending to 20 miles from the centre; but that as regards depth of water, the Thames compares not unfavourably with the Maas, and has the advantage of the Scheldt, the Elbe and the Weser.
3. That a comparison cannot well be drawn from the continental ports with regard to the system of levying dues and charges, inasmuch as those ports are administered and financed wholly from imperial or municipal sources (save in the case of Bremerhaven so far as that port receives

financial support from the North German Lloyd Company) and no separate accounts of the ports are available, but it is a fact that there are practically no port dues on goods in these ports.

4. That the question of the adoption of closed docks as against open ones or river quays would appear to be governed by tide conditions, and that wherever the range of tide is in excess of 13 or 14 feet closed docks are considered essential for large vessels.

5. That there should be no delay in constituting some authority for the Port of London, so composed as to command not only public confidence, but the confidence of the commercial and trading interests concerned in the port, and which may be able to decide the main issues at stake, viz. what are the deficiencies of the Port of London and how they are to be met.

### UNDERWATER CONSTRUCTION.

In the course of his presidential address at the Institution of Civil Engineers, Sir William Matthews, K.C.M.G., said that hitherto it had been taken that 70 feet was the maximum depth in which divers could work with economical results or sustained effort. Where works had to be carried on at greater depths, men employed for any length of time under such circumstances, either in the dress or in bells, were liable to a species of "caisson" disease, partaking of the nature of cramp or paralysis. Mr. Moir, who supervised the construction of the Blackwall Tunnel on the part of Messrs. Pearson, the contractors for that work, experienced the same difficulty with the men engaged there when under air-pressure, and with a view to mitigate the extent and effects of the disease, provided, for the first time, a chamber for the reception of patients, where, under the influence of reduced pressure, intermediate between the intensified atmosphere in which they had been employed and the normal condition at the surface, they were gradually brought to a state of recovery. With respect to tunnelling under air-pressure, it had been long observed that when two cross diaphragms with their necessary air-locks were in use in a tunnel during its construction, the men were much freer from caisson disease than when only one

diaphragm was employed. Recent experiments by the Admiralty, under the direction of Professor Haldane, on deep diving in the dress by navy divers, seemed to afford a reason for this fact, which, as pointed out by Professor Haldane, appeared to be due to the lowering of the pressure in steps or stages, rather than by allowing a continuous and regular drop of gauge-pressure per unit of time. By adopting stage decompression, accompanied by a very slow rising of the diver to the surface, some hitherto unworkable depths have been recently reached, the divers remaining in these depths for thirty minutes at a time, the complete ascent being ultimately made without any observed damage to the men employed. He understood that on more than one occasion a depth of 210 feet had been attained. The experiments had not as yet been carried sufficiently far to show that men in large numbers could be found who could stand this pressure for any length of time, and be able to do hard manual work, but it was possible that these experiments might lead to developments of an important character in subaqueous working. As regards future development of harbours, docks and waterways, they were fully alive to the importance of making due and adequate provision for larger and deeper draught ships, in the designs to be prepared for new works, and also where harbours and docks existed of inadequate dimensions for present requirements. It must not be forgotten, however, that although, all around, ships of increased capacity would have to be accommodated, it was at comparatively few ports that the very largest vessels would be found, at all events for a long time to come, and therefore it might be preferable, in many cases, in view of the exigencies of finance, to proceed tentatively, and to extend hereafter, rather than, in the first instance, to carry out works of undue magnitude, which might remain unremunerative for considerable periods. As to the actual construction of sea-works, the arrangement of their design so that their execution might entail, as far as possible, repetitions of the same process, with the use of heavy masses and the generous application of suitable plant, might be usually expected to produce satisfactory and economical results, as far as the structures themselves were concerned. There are, however, many and not infrequently highly important and sometimes complex considerations associated with such

works, in regard to which it was not possible to lay down general rules, and where the conditions appertaining to each special case should largely determine the procedure to be adopted. Under the most favourable circumstances the carrying out of such works entailed anxiety, the latter being generally equalled, however, by the special interest awakened.

### BRICKWORK AND BOILER EXPLOSIONS.

THE report of Messrs. A. A. Hudson and J. H. Hallett, the commissioners appointed by the Board of Trade to hold an inquiry into the boiler explosion which occurred a year ago at Messrs. Hinks, Wells & Co.'s works, Buckingham Street, Birmingham, has appeared. The report states that the explosion was caused by the failure of the third ring of the left lower drum of the boiler, in a line with the brickwork forming the cover to the lower flues, the metal of the plate at this point having been reduced by corrosion to the thickness of a piece of ordinary brown paper. The corrosion had been partly caused by contact with damp brickwork. The commissioners add that the boiler was insured, but certificates were not given to the owners until the year 1901. From that year the boiler was regularly inspected by Mr. Edward Robinson, an engineer inspector employed by the insurance company. The certificates and reports of Mr. Robinson all showed that the scaling and cleaning were properly carried out by the owners, except in two cases. In the first, in 1902, the scaling did not prevent him giving a certificate, but in 1904 he deferred giving his certificate until more scale was taken off. In this case, however, after the boiler was properly scaled he issued his certificate in due course. He told them (the commissioners) that except in the year 1902, when dampness was discovered at the back end of the boiler, he never required any of the brickwork to be removed. The commissioners relieve Mr. Robinson of any responsibility, and also the owners, who had willingly offered every facility for the examination of the boilers. With regard, however, to Mr. Crosland, the chief engineer to the insurance company, and Mr. Robinson's chief, the commissioners state that he, as a competent person under the Factory Act, in issuing certificates, ought to have exercised his judgment as an engineer,

apart from the policy of the company. The policy of the company not to require brickwork to be removed unless there is either dampness or suspicion of defects is not, in the commissioners' judgment, a sound one, certainly not as regards the safety of the public, although it may be a good business policy. As applied to this case, their chief engineer would not, as a prudent man and an engineer, say that the brickwork ought not to have been removed, and the commissioners do not see how he could have said otherwise, for while the boiler, owing to its peculiar construction, required special attention, the brickwork had never, for the purposes of an examination of the boilers, been removed for thirty years, except a small portion at one end in 1902. They consider, therefore, that the engineer, in carrying out the policy of the company in their commercial interest, contrary to his better judgment as an engineer, is responsible with the company for this explosion. The commissioners remark they are always told the brickwork cannot be removed without dislocating business, but they fail to find any particle of reason why the brickwork in this case should not have been removed. No suggestion has been made that the owners would have raised the slightest objection to doing anything required of them by the company, and as to dislocation of business, they always had a spare boiler which they could use at any time. In fact, only two boilers were ever used at one time in the business out of the three which were on the works.

The commissioners directed that Mr. J. F. L. Crosland should pay the sum of 50*l.*, and the Vulcan Boiler and General Insurance Company the sum of 100*l.* to the Solicitor to the Board of Trade towards the costs and expenses of the investigation.

THE ceremony of cutting the first sod of the Harborne Tenants' Estate was performed recently on the site which adjoins Park Hill Road, Harborne. The Harborne Tenants' Society has been formed to promote the erection of co-operative ownership and administration of houses on principles similar to those at Ealing Garden City and Bournville. The site contains 53 acres of land, for which 15,500*l.* has been paid. It is of an undulating character and within easy access of the main Harborne Road and the railway station.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

TENDERS, ETC.

\*\* As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

COMPETITIONS OPEN.

HERTFORD.—Nov. 30.—The Corporation of Hertford invite designs for the erection of offices at a cost not exceeding 3,500l. Premiums of 50l. and 20l. will be awarded. Particulars can be obtained from Mr. John H. Jevons, A.M.I.C.E., borough surveyor, Hertford.

THURLSTONE.—Nov. 25.—The Thurlstone Urban District Council invite plans for council-room, offices, caretaker's house and outbuildings (cost not to exceed 650l. for building and heating apparatus only). For instructions and particulars apply to Mr. J. Wadsworth, clerk, Thurlstone, near Penistone.

WARRINGTON.—Nov. 30.—The Directors of Warrington Garden Suburbs, Ltd., invite architects practising within a 30-mile radius of Warrington and architects having previous experience in the planning of garden suburbs to submit competitive designs for laying-out their estates at Great Sankey and Morrisbrook Farm, Grappenhall. Conditions and particulars may be obtained on deposit of 1l. 1s. Mr. A. Bennett, Secretary to the Company, Market Gate Chambers, Warrington.

WIGAN.—The committee appointed by the county borough of Wigan invite models and sketches for a statue to Sir Francis Sharpe Powell, Bart., M.P. An assessor will be duly appointed. Mr. Harold Jevons, Town Clerk's Office, Wigan.

CONTRACTS OPEN.

ALDERSHOT.—Nov. 29.—For rebuilding the Princess Hotel, Union Street. Messrs. Friend & Lloyd, architects and surveyors, Grosvenor Road, Aldershot.

ANNFIELD PLAIN.—Nov. 25.—For erection and completion of two houses at Lanchester, and additions to boot and shoe department at Annfield Plain, for the Co-operative Society. Mr. Geo. Thos. Wilson, architect, 22 Durham Road, Blackhill.

## TRADE NOTES.

MESSRS. BASTON & Co., who are known for their contractors and builders' machinery, have introduced an improved "elephant" which adds vastly to the power of vertical spindle machines. Their patent "One and all" seems to be equal to every requirement, such as moulded sunk panels, undercut mouldings, difficult stair shaping, tracery-work, mortising, geometrical forms for seat ends, stop chamfering, &c. Many builders have testified to its value in joinery, and there can be no question that it will soon save the outlay on it by the saving of labour.

AGAIN it is a duty to call the attention of all engaged in building to the special diaries and blotting-pads which Messrs. Hudson & Kearns have been producing during a great many years. They have been loyal to the representatives of construction and are entitled as such to general recognition. Purchasers have become accustomed to special kinds, but the blotting-pads marked "No. 8" and "Bankers" will be found most convenient in offices.

A LARGE clock is just being erected in the church at Clifford Chambers, Stratford-on-Avon, by Messrs. John Smith & Sons, Midland Clock Works, Derby. It is being fitted with all the latest improvements and generally to the designs of the late Lord Grimthorpe. The same firm made a clock for Halford Church about thirty years ago.

MESSRS. E. H. SHORLAND & BROTHER, of Manchester, have recently supplied their warm-air ventilating patent Manchester grates to the Council schools, Lewes.

ONE of the special constructional features in the London County Council Day Training College just opened in Southampton Row relates to the floorings adopted there, which are on the well-known "immovable-acme" system of "dowelled" wood blocks (W. Duffy's patents), used for many years by the late School Board for London, and continued by them up to the time of the London County Council taking over the educational department, who continue to use this system throughout the schools, institutes, &c., coming within their jurisdiction. This decision is the result of it having been found that in the cases of school floors particularly—which are necessarily subjected to hard wear and tear—it is imperative that a really durable description of flooring should be adopted.

MESSRS. BRUCE PEEBLES & Co. have been provisionally awarded the contract for the electrification of the Moscow tramway system. The total cost will be upwards of 2,000,000*l.*

THE tender of Messrs. Underwood & Brother, of Dukinfield (23,237*l.*), has been accepted by the Cowlyd Water Board (Conway) for the laying of a new water main from Dolgarrog to Sarn Mynach.

THE Edinburgh Lunacy Board have agreed to a recommendation by the works committee to approve of a plan for the completion of the water supply to Bangour village in view of the probability of a greater supply being required in future, and the serious expense which would be entailed in obtaining a provisional order for extension of time to complete the works at Bangour. It was stated the cost would be about 1,000*l.*

THE health committee of the Birmingham City Council held a special meeting on Tuesday to consider the building plans of the chalets to be erected at Salterley Grange, near Cheltenham, on the estate already acquired by the Corporation for the purpose of providing a sanatorium for consumptives. In addition to the chalets, considerable structural alterations to the house are necessary in order to adapt it to the requirements of an administrative block. Plans for this were also considered, and the committee will shortly make a recommendation on the subject to the City Council.

## VARIETIES.

THE Admiralty have decided to rebuild at a cost of about 50,000*l.* the western section of the Admiralty break-water at Dover, which was broken through the *Finland* collision. The operations will occupy about a year.

At Kilmarnock Dean of Guild Court on Monday plans were passed for the erection of a technical school in Elm-bank Drive at a probable cost of 16,000*l.*

THE Admiralty has decided to erect a large electricity station at Dover for power and lighting for the naval harbour. The contract for the work has been secured by a Dover contractor.

THE Corporation of Shoreditch were ordered in the King's Bench Division last week to pay to Mr. T. S. Harman, a contractor, 2,250*l.* and costs in respect of a fire at his premises, caused, in the opinion of the jury, by an electric motor which the Corporation had supplied.

THE Bury Joint Water Board have informed Haslingden Corporation that the high-level reservoir at Scout Moor will not be completed next summer as was hoped, and that they propose to ask Parliament for an extension of the time allowed for completion.

MR. G. W. CHILVERS has been appointed, in consequence of the death of the late Mr. E. Tidman, surveyor and secretary to the London and Suburban Sanitary Survey Association, 28 Victoria Street, S.W., with which his private practice has been merged.

THE town authorities of Winnipeg, Canada, have secured power to put plumbing into houses, calculating the expenses on a seven years' basis, the cost being levied on the property

thus improved. The aim is to help people who cannot afford the whole cost at once to make their houses sanitary.

MR. W. H. TRENTHAM, consulting engineer, informs us that he has taken into partnership Mr. A. E. Heming, recently constructional engineer to Marconi's Wireless Co., Ltd. The title and address of the firm will be "Trent-ham & Heming," 39 Victoria Street, Westminster.

THE *Pall Mall Magazine* Christmas Number has just been issued, and is up to the usual standard of this excel-lently produced magazine. An interesting illustrated article appears from the pen of Mr. Egan Mew, entitled "The Collection of Antiques."

MESSRS. PATMAN & FOTHERINGHAM, of 100-2 Theo-bald's Road, have secured the contract for the Norwich Union Insurance Society at the corner of St. James's Street, W., and Piccadilly. This is to be a very handsome building, with marble front, &c. Messrs. Rüntz & Ford are the architects, of Brook House, Walbrook, London, E.C.

THE Southwark Borough Council are diverting the mains at the Elephant and Castle preparatory to construct-ing subways for pedestrians, which have become necessary owing to the enormous pressure of motor-bus, tram and general traffic which now pertains to this point. In all the work will cost something like 13,000*l.*

THE Llandudno Pier Company announce that they intend to apply to the Board of Trade next session for a provisional order empowering them to widen the pier, to erect and maintain pavilions and other buildings, to acquire certain lands, to lay down a line of tramway, to supply electrical energy and issue new by-laws and regulations.

At the meeting of the Salford Board of Guardians last week tenders were opened relating to an extensive alteration of the drainage at the infirmary. Many of the tenders exceeded 8,000*l.* in amount, much to the surprise of the members of the Board. After the lowest tender by a local firm had been considered, it was agreed to appoint a special committee in order to see if a couple of thousand pounds could be saved.

THE Woodbridge Urban District Council have accepted the offer of the Suffolk Electrical Supply Company to light the streets of Woodbridge during the next seven years for 350*l.* per annum, the company to reimburse the Council for

obtaining expert advice. Electric lamps of the Osram type are proposed, and the contract is to include the provision, erection and maintenance of all the machinery and apparatus required. The average annual outlay for gas during the last four years has amounted to about 370*l*.

A PARLIAMENTARY return has been issued of all contracts made in the United Kingdom for manufactured articles by the various Government departments in the past year, either with contractors outside the United Kingdom or with contractors or agents who obtain the articles from abroad. From this it appears that the Admiralty contracts of this kind were 97,827*l*; War Office, 325,584*l*; Home Office, 1,726*l*; Metropolitan Police, 706*l*; prisons, 13,704*l*; Post-office, 56,340*l*; stationery, 16,131*l*; and works, 6,565*l*.

The large building known as Parkside, which adjoins the French Embassy at Knightsbridge, has been completed. On the ground floor are twelve shops, and above are forty-six suites of rooms. The architects are Messrs. A. H. Hart & Paul L. Waterhouse. On Tuesday Sir Thomas Brooke-Hitching and Mr. W. B. Essen, the owners, were entertained at luncheon by the architects. Among those who spoke on the occasion were Mr. Beattie, secretary of the Waring-White Building Company, Ltd.; Mr. Denell, the managing director; and Mr. Leaning, the quantity surveyor.

THE Teddington Urban District Council have considered the question of the erection of a new bridge over the Thames at Teddington, and have unanimously adopted the following resolution:—"That the County Council of Middlesex be requested to consider whether the time has not arrived when a bridge across the Thames at Teddington for vehicular traffic might, with advantage to the counties of Middlesex and Surrey, be erected, and thereby relieve the congested state of traffic at Kingston and Richmond bridges and certain other roads leading thereto." At present there is a suspension bridge for foot passengers at Teddington, but no bridge for vehicular traffic between Richmond and Kingston, a distance of about five miles.

THE Chemical Cleaning and Drying Company, 6 Argyll Street, W., of which Mr. T. Harris is manager, in order to carry out their numerous orders have introduced four of

the new Barbe machines by means of which the acme of dry cleaning can be reached. They are specially adapted for furniture fabrics: they are of large size, and all goods go through a series of processes until by means of force and special cleaning spirit every particle of foreign matter is removed. When the goods are dry they are taken out and subjected to the finishing operations. The system is well adapted for antique and valuable textiles. The chemical action of ordinary drystuffs and cleansing mixtures is to affect colours and often injuriously. But by the Barbe system there is no risk of that kind, and the colours are restored to their pristine beauty. Architects who may be consulted concerning valuable furniture fabrics would do well to visit the establishment.

THE Birmingham Corporation gas department has issued a circular letter to certain customers resident outside the city, who have been approached with a view of inducing them to discard the use of gas in favour of electricity for lighting their premises. The letter states:—"For lighting residential property, electricity at 4*d*. per unit is several times more costly than an up-to-date system of lighting with gas at 2*s*. 6*d*. per 1,000 cubic feet. One ordinary incandescent gas burner, lighted an average of three hours per day throughout the year, and yielding sixty-five candles of light, costs 12*s*. 4*d*. per annum with gas at 2*s*. 6*d*. per 1,000 cubic feet; whilst a similar volume of light from ordinary carbon filament electric lamps, with current at 4*d*. per unit, would cost 4*l*. 13*s*. 5*d*. The combustion of gas in a properly-ventilated room creates a good current of air, which helps to change and freshen the atmosphere of a room to a greater extent than would be the case if electricity were used.

THE proposed acquisition of "Beckett's Park" for Leeds at a cost of over 250,000*l*., is causing much discussion locally. The park was the seat of Lord Grimthorpe, and the Leeds Corporation, by a majority of two, have rejected the proposal to purchase the estate. A special committee recommended that the estate should be acquired by the Council, a portion of the 464 acres to be used as a site for permanent training colleges, about 92 acres to be made a public park and the remaining portion of 290 acres to be sold off as building land.

WM. E. PECK & CO.  
(Incorp.)  
8 BRADFORD AVENUE, LONDON, E.C.

THE City lands committee of the City Corporation has issued an order asking for the rigorous closing of the windows in the new Central Criminal Court. The chairman states that it has been pointed out that the efficiency of the system of heating and ventilating which has been installed in the structure at very great expense is seriously impaired by the opening of the windows. Enormous volumes of warmed and purified air have, he states, been allowed to escape in this way, and the interference with regular currents of air flowing through the ducts has resulted in a disorganisation of the system not confined merely to the rooms where windows have been opened.

GLASS telegraph poles are to be manufactured in a factory recently built at Grossahmerode, Germany. An architect of Cassel has been granted patents in Germany and other European countries and in the United States for a machine to be used in their manufacture. The glass is reinforced by wires suitably disposed. These poles, it is believed, will be particularly adapted for use in countries where wooden poles are quickly destroyed by insects or climatic conditions.

ACCORDING to the annual report of the inspector of plumbing at Washington, U.S.A., the labour troubles that have existed in this city during the year have greatly retarded building activities. The report shows that there were 32,100 inspections made, which is an increase over that of last year of 1,915, and 4,763 over the year previous. Inspector Davis points out that there are only six field inspectors employed in his office, who have to look after the work of 195 registered plumbers. The sum of 50,000 dols. is suggested as necessary for similar work for the coming fiscal year. Public baths and baths for the public schools are urged as public necessities.

THE November report of the Amalgamated Society of Carpenters and Joiners states that the total membership is 70,100. On unemployed benefit there are 3,854 members, and on sick benefit 1,519 members. Mr. Chandler announces that the South-western Counties Federation of Building Trades' Employers have joined the National Conciliation Board of the Building Trades. This embraces the towns of Bath, Bridgwater, Bristol, Cheltenham, Exeter, Gloucester, Hereford, Stroud and Taunton. Liverpool branch pro-

poses:—"That this branch considers the Conciliation Board is of no advantage to the joiners' societies, and asks the Executive Council to place the question of withdrawing from it before the members."

A HIGH tribute is paid to the progressiveness of some of the Chinese by Mr. A. W. Pontius, the United States Vice-Consul-General at Newchang, in a report to the Washington Bureau of Manufactures. He says the Chinese authorities are making good progress in establishing a proper drainage system throughout the Chinese city of Newchang, and although some hundreds of feet of drains have already been constructed, the work is still far from completion. Several of the main roads have been macadamised, and the clean appearance of the streets is evidence of the painstaking work of the Board of Sanitation. No refuse of any nature is allowed to be promiscuously dumped, and all shopkeepers are instructed to keep their premises in a sanitary condition. The foreign quarter has not been neglected, and the principal streets are all being macadamised, which is commendable on the part of the Chinese authorities, as very little in the way of taxes is realised from the foreign section. The authorities, in realising the fact that they must keep up the work so ably conducted by the Japanese, are more than anxious to demonstrate their capabilities in governing and regulating a treaty port which is practically controlled by them.

THE town clerk of St. Pancras has received a letter from the London County Council with regard to the Borough Council's refusal to contribute specially towards the formation of a new road between Gray's Inn and Pentonville Roads, and the erection of a bridge, 60 feet wide, over the Metropolitan Railway station at King's Cross, stating that, in the event of the continued refusal of a contribution, the County Council will have to consider the advisability of merely building a bridge sufficient for tramway purposes, without providing for ordinary pedestrian and vehicular traffic. It is mentioned that, by an alteration of the original plan, the greater improvement can be effected for 35,000*l.* instead of 40,000*l.*, the first estimate. The view of the general purposes committee of the Borough Council was that the improvement should be charged to the tramway account, or undertaken as a metropolitan, and not simply as a local, improvement; but they have addressed

another communication to the County Council in reply to the last letter, and promise to report on receiving an answer.

### A DRAWER STOP.

A common cause of complaint with housekeepers is that with even expensive drawers it is not possible to make them dust-proof. In museums costly construction in metal has to be adopted to attain that end. Mr. James Parkinson, of Liverpool, has patented a drawer stop which is easy of application and is effective. It will be seen from

Section showing Drawer Closed.

Section showing Drawer Open.

the wood-block that a slip is screwed on the inside of the front of the drawer. The top or bearer has another slip, and, as will be observed, the projection in one fits into the hollow of the other slip, and the drawer becomes more tightly closed than is possible with plain surfaces. Like many of the most useful inventions it appears simple. But there is little doubt it can securely answer the purpose for which it was intended.

### DRY BASEMENTS.

In our changeable climate, it is impossible to foretell when sewers will be found not equal to unanticipated demands on their capacity. In such cases the basements of houses suffer. To meet those emergencies is the object of Couzens' patent gully trap, manufactured by Messrs. G. & F. Couzens, of Cardiff. By means of a copper ball with an india-rubber casing above and below it, water is prevented from rising above the level of the gully. In dry weather

when the water runs low the ball subsides, and becomes an efficient obstacle to bar the entrance of sewer-gas. The arrangement is so simple, there is little likelihood of either

the ball or the seating failing in effect. A copper ball is also made an auxiliary in an interceptor, by which stoppage can be remedied simply by removal of an iron cover without opening the ground. The drain-rods can then have sufficient space to work in without the body of the water being increased.

### NEW CATALOGUES.

The catalogue of the chimney-pots and cowls belonging to the "Empress" smoke cures of Messrs. Ewart & Son, Ltd., clearly illustrates all the varieties which are adapted to meet the varying whims, as it were, of an enemy who unfortunately is allowed to have too much power. The principle is a movable head, which is noiseless owing to the ingenious method adopted for lubricating the parts. When oil is mentioned it might be supposed that constant attention is required. But the inventors say that when once oiled the cowl will work for many years without attention. There are special chimney-shafts, flues, wind-guards and slips, and the prices are moderate.

For a great many purposes concrete blocks and bricks are serviceable and they have been extensively employed in the United States. Some may suppose that they are

# CABOT'S INSULATING AND SOUND-DEADENING QUILT

PREVENTS THE TRANSMISSION OF SOUND through walls and floors by absorbing and breaking up the sound waves. No other Deafener does this.

KEEPS OUT HEAT OR COLD exactly as do the feathers of a bird; providing innumerable minute dead-air spaces, giving highest insulating power. Will save enough fuel in a single Winter to pay for itself. Keeps a room warm in Winter, cool in Summer. DECAY, MOTH, AND VERMIN PROOF, AND UNINFLAMMABLE.

Scientific investigation has proved that for HEAT INSULATION or SOUND-DEADENING the highest degree of efficiency, with economy in cost and extreme durability, has been attained by CABOT'S QUILT.

easily made. But if they are to compete with bricks or machine-cut ashlar it is necessary that appearance should be considered. The Swansea Stone Block and Machine Company, Ltd., produce machines which are adapted to all the varieties of concrete blocks which are now in use. They are obtainable at so low a price they are enough to tempt any steady workman to set up in business as a concrete builder. One man can work the machine and turn out from twenty to twenty-four blocks in an hour. The catalogue supplies sufficient information about the whole process to enable anyone to conduct it. The outlay is so moderate that managers of estates would find it advantageous to have one or more of the machines in order to meet sudden demands where neither skilled labour nor bricks are at command. In the Colonies the machines would be invaluable. There is also one adapted to produce hollow blocks with plain faces, or rough faced, or as smooth as tooled ashlar. There are special machines for window and door sills, pavement blocks and fencing. The company also produce machines for bricks of sand and cement. It may be said without exaggeration that the system bids fair to cause a revolution in many kinds of building construction.

### TRAINING OF ENGINEERS.

An address was delivered by Professor S. M. Dixon, as president of the Birmingham Association of Students of the Institution of Civil Engineers. He said that although in the Birmingham University there were three separate departments of engineering, it was important to note that the work of these three departments was most intimately connected. All students working for the degree (which carried exemption from the examination for Associate Membership of the Institution of Civil Engineers) were required to work in the three departments. In fact, the existence of these three departments was as essential for the organisation of the work of instruction for that part of the course which was taken by all students as for the specialisation of the work for the advanced students. Specialisation began partly in the third year, and was carried out completely in the fourth year of study. It must be remembered, therefore, that many of the courses

both in the lecture-room and laboratory given in the civil engineering department were taken by students who were specialising in electrical and mechanical engineering, and in the same way those students who were looking forward to degrees in civil engineering spent a large portion of their time in the workshops, laboratories, drawing offices and lecture-rooms of the mechanical and electrical departments. In fact, the aim of those in charge was to make the training broad as well as thorough. Those who had drawn up schemes of university education for engineers had generally found that the limits of the course in civil engineering were more difficult to determine than any of its branches. In laying down the courses the most important question to decide was which of the many important subjects might be omitted, for few people realised sooner than engineers that the day contained only twenty-four hours. Once they fully grasped the fact that it was impossible in any university course to accomplish more than a small part of the preliminary training of the engineer, and that the work of the university school was not to make engineers but to fit men in the best way possible to become engineers, they found that it was the principles and not the innumerable details of engineering practice on which stress should be laid in a college course.

At the close of the lecture Professor Dixon conducted the party through the laboratories of the university, and gave demonstrations with the various testing and hydraulic machines.

### THE FORTH BRIDGE FOUNDATIONS.

A STATEMENT gained currency on Saturday that the Dunfermline Incorporation of Guildry had the power, if they so desired, of excavating the whin rock beneath the north cantilever of the Forth bridge, and that an omission on the part of the Forth Bridge Railway Company to obtain more than a surface right when the ground was acquired for the purposes of the bridge might result in compensation having to be paid to the Guildry and its tenants. We are informed, says the *Scotsman*, that the facts are as follows:—The main pier of the bridge adjoining the quarry worked by Messrs. Brunton, the quarry tenants, is not, as was stated, erected upon property formerly belonging to the Guildry, but upon

a site purchased from other proprietors, so that the present dispute in no way affects the stability or safety of that pier, for the better protection of which an additional area of rock was, we understand, taken some three years ago, so as to form a buttress between the pier foundation and the rock being quarried. We learn also that the railway company in 1883 served upon the Guildry the usual statutory notice of their intention to take certain adjoining lands, one part of them lying to the south of the present pier opposite the quarry, and another part further to the east, on which the present coastguard station was erected. Having failed to arrive at an amicable settlement of the price, the matter was referred to arbitration, under which the Guildry claimed for their interest in the rock as well as in the surface, and were paid for both, the amount awarded being made up of something like seven-eighths of the total for the rock, and the oversman's formal award contains an express obligation upon the Guildry to convey the subjects, and also to discharge the railway company of all claims at their interest therein. A conveyance was taken on these lines. Lately the quarry tenants in prosecuting their operations reached the boundary of part of the property acquired from the Guildry situated under one of the spans of the bridge, and as it appeared not to be the intention of the quarry tenants to discontinue the removal of the rock at what was considered the boundary, the company called the attention of the Guildry to the matter, and were surprised to learn that the latter claimed to be still owners of the rock underneath that ground, on the plea that the conveyance to the company does not specially mention minerals, and that as the deed is a statutory one it does not therefore carry the rock. The question is to be submitted for adjudication, and not a little interest attaches to the point, because one element of contention will doubtless be whether whinstone, in the general acceptance of the term, is or is not a mineral, or at least was so regarded at the time of the transfer. It was only within the last few years that a judicial deliverance was obtained by another company regarding freestone, which has been defined to be a mineral. Clay other than surface clay was generally supposed to be in the same category, until the House of Lords recently decided otherwise in the case of the North British Railway Company *v.* Turners, Ltd., relating to the clayfield at Portobello.

### MANCHESTER CATHEDRAL.

UNDER the advice of the architect the fabric of the Manchester Cathedral is at present undergoing thorough repair. Much of the stonework and roof requires immediate attention. The cost will be heavy, and it is estimated that the portion for which the churchwardens are liable will alone be about 1,000*l.* Although the revenue from the Chapter estates is very large, amounting to more than 45,000*l.* (the greater portion being handed to the Ecclesiastical Commissioners and by them distributed amongst the incumbents of churches within the old parish of Manchester), no part of it comes into the hands of the churchwardens, who have to rely entirely on voluntary contributions, mainly made at Divine service. This resource is not sufficient to meet an extraordinary outlay, and the Dean and churchwardens have issued an appeal for funds.

### THE QUEBEC BRIDGE.

At the annual general meeting of the Royal Scottish Society of Arts, Professor T. Hudson Beare, of Edinburgh University, the president, occupied the chair.

The President, after referring to the losses by death which the Society had sustained during the preceding session, and to the papers which had been read, passed on to the main subject of his address, which was entitled "Some Notable Events in the Engineering World during the Session 1906-7." The lecturer first dealt with the Quebec bridge. This bridge, which will cross the St. Lawrence close to Quebec—about 350 miles above the mouth of the river—was of the cantilever type. It had an overall length of 3,240 feet, with two anchor spans of 500 feet each and one 1,800 feet central span, at a height of 150 feet above water level. The big span exceeded those of the Forth bridge by 90 feet. The total weight of the superstructure was about 40,000 tons. The bridge was designed and constructed by the Phoenix Bridge Company, who were also responsible for the erection up to the time of the disaster. The consulting engineer was Mr. T. Cooper. In the Quebec bridge, following the usual American custom, the various parts of the structure were pin-connected, the top chords of the cantilevers being built up of huge eye-bars, while the lower compression chords

SQUARE, E.C.**

were rectangular boxes, built up of four webs, each constructed of steel plates. This form of construction of the compression members was open to criticism, as such struts were far less rigid than the cylindrical compression members of the Forth bridge. Claims had been made that the Quebec bridge showed considerable economy in design as compared with the Forth bridge, since the ratio of dead load to live load in the case of the latter bridge was  $9\frac{1}{2}$  to 1, while in the Quebec bridge it was designed to be only  $4\frac{1}{2}$  to 1. This economy had been obtained, however, only by materially increasing the working stresses in different parts of the structure. In the case of the Forth bridge, where the steel used had a tenacity of 34 tons to 37 tons per square inch, the working stress adopted in the compression members was only  $7\frac{1}{2}$  tons per square inch, and this after making allowance for a wind pressure of 56 lbs. per square foot. In the Quebec bridge, though the tenacity of the material only ranged from 27 tons to 30 tons per square inch, very much higher working stresses had been adopted. In its general details the bridge corresponded closely with those of other large American cantilever bridges, and there was no doubt that the greatest care had been taken in securing the best quality of material and the very best workmanship. The work of erection had been in progress for three seasons, and it was expected to complete the entire bridge in the year 1909. The overhang at the time of the accident was apparently about 800 feet. On the afternoon of August 29 last the entire completed superstructure on the south side collapsed instantaneously, killing 75 out of the 86 men who were working on it. From reports by those on the spot, it appeared that the whole structure fell within probably half a minute of the first collapse. At the time of the collapse all conditions were normal, and there was nothing, therefore, from this point of view to account for the disaster. A careful examination of the wreckage showed that the anchor arm moved bodily forwards towards the river, and its upper tension chords apparently maintained to a considerable extent their relative position. It had been stated that two days before the actual collapse the webs of this chord showed signs of buckling. Unfortunately, steps were not taken to remove at once the men erecting the bridge until the cause of this weakness could be investigated; and this

led to a lamentable loss of life, which might otherwise have been saved. The lecturer stated that it was not desirable nor right that any positive opinion should be expressed with regard to the cause of this disaster until the completion of the inquiry which had been undertaken by the bridge builders and by the Canadian Government. He himself, however, was of opinion that the ultimate cause would be found to be faulty design, and not bad workmanship or bad material.

### FOLKESTONE PIER.

At the ordinary meeting of the Institution of Civil Engineers on the 12th inst., a paper read was "The Extension, Widening and Strengthening of Folkestone Pier," by Mr. Hugh Torrance Ker. The author described the important harbour works which were carried out by the South-Eastern Railway Company at Folkestone during the eight years 1897 to 1905. A short historical account was given of the early works carried out for the purpose of providing shelter, and of the continuous fight against the travelling shingle which tended to block the harbour entrance. The accumulation of shingle against these earlier works resulted in high-water mark being pushed about 900 feet seaward and the reclamation of about 26 acres from the sea.

The old pier, in 1897, was in a very dilapidated condition and ill adapted for the rapidly increasing traffic. The number of passengers by the Folkestone-Boulogne route in the year 1905 was 257,000 and the value of the goods dealt with was 12,500,000*l.* The new works, designed to meet the increased traffic requirements, comprise the extension of the old pier by 900 feet of solid work, with the provision of four new berths available at all tides and in all weather; the protection of the west face of the old pier by a solid wall carried down to a secure foundation; the strengthening of the root of the pier by a wall founded on cylinders and protected by a wave-breaker of 20-ton blocks deposited pell-mell; the renewal of the east face of the old pier in greenheart piling, and the provision of a new deck throughout its length. The pier is provided with a sheltering parapet along the whole of the western side. The parapet covers the railway-platforms

and provides a public promenade on the top. The main lines and sidings on the pier are controlled by electric signalling, and the whole of the pier, landings, station-buildings, &c., are lighted by electricity. The pier terminates in a round head 65 feet in diameter, upon which stands a granite lighthouse, exhibiting a fourth-order double-flashing light; and a fog-horn house with air-compressing machinery.

The paper proceeds to describe the construction of the new works, and gives details of the extension, which was composed of 20-ton concrete blocks, of which 133,500 cubic yards were used in the works.

Reference is made to the methods adopted for testing cement, and particulars are given of the boiling-test used as a measure of the aeration necessary. Experiments were made with 100-ton lots to ascertain the increase of volume due to aeration, and particulars are given of one of the consignments tested in this manner which continued to increase at a rate sufficient to pay the cost of turning the cement up to the twenty-second turn. Tests extending to three years were also made of cement which had been adulterated with gypsum to control its setting properties, and the results are given, showing a serious diminution of strength in the last year of the test with neat cement, but a steady increase with the mortar test.

After a description of the block-making and stacking, mention is made of the staging from which the actual building was carried on. This staging was 101 feet wide and 400 feet long, with its rail-level 21 feet above high water. It was formed of Oregon pine piles 18 inches by 18 inches, carrying lattice girders of 40 feet span. The staging carried two 30-ton and two 20-ton goliath cranes. The 30-ton goliaths were used for handling the diving-bells, of which there were two, each 13 feet by 10 feet by 6 feet, weighing 26 tons. The 20-ton goliaths were used mainly for block-setting. The blocks below low water were set block to block, without beds, by the divers. Above low water the blocks were set in beds of 2-to-1 mortar, and the joints were grouted. At the outer end of the pier the foundation was 63 feet below high water. The whole of the west side of the pier is protected against undermining by a concrete apron 13 feet wide. Above low water the pier is faced with granite which was built into the blocks

in the yard. Grooves are formed in the granite where the landings occur, to receive the greenheart piles which carry the decks of the landings. Each berth is provided with a lower landing, 20 feet wide, so that passengers may embark with convenience at any state of the tide. Slipways are also provided for the shipment of horses, of which traffic there is a considerable amount passing through Folkestone.

The paper next describes the strengthening works at the root of the pier where, owing to the proximity of the old work and the amount of cover to be removed before obtaining a good foundation, it was necessary to resort to cylinders to obtain a secure footing in the lower greensand beds. The site of the cylinder foundation was in a re-entering angle exposed to a heavy wave-stroke. The cylinders, which were 11 feet in diameter, were in two rows. Those in the front row were built up of steel rings 5 feet deep, while in the back row the cylinders were made of concrete in sections, each weighing nearly 20 tons. The steel cylinders were sunk by means of compressed air, and the concrete cylinders by grabbing in the usual way. The obstructions met with during the process of sinking consisted of the debris of the old pier in the shape of rocks, concrete and old rails, which had to be cut through. The blockwork wall built on the top of the cylinders was backed with chalk filling, upon which the main pier-station was built. The cylinder-wall was protected from the abnormal wave-stroke at this point by a wave-breaker composed of 460 blocks, each weighing 20 tons, placed as irregularly as possible.

The main passenger-lines running on to the pier had been liable to damage during stormy weather owing to the loss of shingle which occurred during gales. Foreshore-protection works of a permanent character were therefore constructed, consisting of groynes, breast-walls and rock-work barriers.

The paper concluded with a description of the greenheart face and new landings provided on the east face, and with a notice of the special cranes provided for the rapid handling of baggage. The works were designed by Messrs. Coode, Son & Matthews, and were carried out by Mr. Wm. Rigby, as contractor. Mr. Ker acted as resident engineer during the construction.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

TENDERS, ETC.

\*\* As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

COMPETITIONS OPEN.

DUDLEY.—The Dudley education committee propose to erect a day training college. Architects desirous of sending a competitive design for the building are requested to make application to Mr. J. M. Wynne, secretary and director, Education Offices, Dudley, giving full particulars of similar work already carried out by them.

HERTFORD.—Nov. 30.—The Corporation of Hertford invite designs for the erection of offices at a cost not exceeding 3,500l. Premiums of 50l. and 20l. will be awarded. Particulars can be obtained from Mr. John H. Jevons, A.M.I.C.E., borough surveyor, Hertford.

MAIDENHEAD.—Designs for a new secondary school, for the Berkshire education committee. Awards of 100l., 50l. and 25l. respectively. Assessor to be nominated by President of R.I.B.A. Particulars and conditions, 5s. The Education Secretary, the Forbury, Reading.

WALES.—Dec. 19.—The Llandrindod Wells Urban District Council invite competitive schemes for (a) laying-out recreation ground; and (b) erecting a pavilion and other buildings. Full particulars are obtainable from Mr. D. C. Davies, clerk, Llandrindod Wells.

WARRINGTON.—Nov. 30.—The Directors of Warrington Garden Suburbs, Ltd., invite architects practising within a 30-mile radius of Warrington and architects having previous experience in the planning of garden suburbs to submit competitive designs for laying-out their estates at Great Sankey and Morrisbrook Farm, Grappenhall. Conditions and particulars may be obtained on deposit of 1l. 1s. Mr. A. Bennett, Secretary to the Company, Market Gate Chambers, Warrington.

CONTRACTS OPEN.

ARMY CONTRACTS.—The Secretary of State for War gives notice that builders desirous of being applied to when tenders are invited for work in the several military districts of the United Kingdom, and whose names are not already on the War Office List, should address the General Officer

EXTENSIVE additions are to be made to the Beckenham (Kent) electricity works.

A new swimming-bath is to be erected at Croydon. The building will measure 120 feet by 61 feet, and the bath itself 100 feet by 35 feet. The cost is estimated at 8,000*l*. A gallery for spectators on both sides will be included in the scheme.

In May 1906 a Royal Commission was appointed to inquire into the expediency of instituting in Scotland a system of registration of title. The Commission took evidence in Edinburgh in the early part of this month. They have arranged to hold a meeting in London on Monday next, December 2, to examine witnesses on the working of the compulsory system that has been on trial as an experiment in the County of London since January 1899. The witnesses summoned include Messrs. T. Cyprian Williams and B. L. Cherry, counsel; and Messrs. C. M. Barker, C. F. J. Jennings and J. S. Rubinstein, solicitors.

## TRADE NOTES.

MR. T. A. CROMBIE, colonial merchant, of 65 London Wall, E.C., the London agent of the Kimberley Borough Council, has shipped this week per s.s. *Bucrania* for the use of the Kimberley Fire Brigade a steam motor fire engine, built by Messrs. Merryweather & Sons, Ltd., of Greenwich. The engine on her trials gave unqualified satisfaction both as to speed and handiness on the roads, and power in pumping capacity, which amounts to 400 gallons per minute.

UNDER the direction of Mr. R. N. Butterworth, architect, Milford, the "Boyle" natural system of ventilation, embracing the latest patent "air-pump" ventilators, has been applied to St. George's school, Harpenden.

THE Selly Oak workhouse infirmary is being warmed and ventilated by means of Shorland's patent Manchester stoves with descending smoke flues, the same being supplied by Messrs. E. H. Shorland & Brother, of Manchester.

THE stonework on the frontage to Daly's Theatre has been very deleteriously affected by the London atmosphere, and much decay has taken place. With the object of preserving the stone from further decay a contract has been placed with Messrs. Farnham, Ltd., to waterproof the whole frontage by their patent paraffin wax process, by which means the pores of the stone are permanently filled with paraffin wax, which renders the further penetration of moisture impossible and therefore effects a permanent cure for the decay. The work is being carried out by Messrs. Farnham, Ltd., under the supervision of Mr. F. T. Verity, F.R.I.B.A., and Messrs. Rüntz & Ford.

THE Bath Stone Firms, Ltd., supplied the St. Aldhelm Box ground stone which was used in Holy Trinity Church, Blackley, Manchester, for which the contractors were Messrs. Webster & Cannon, of Aylesbury. The building was designed by Mr. Basil Champneys. The same firm supplied Monk's Park stone and Cornham Down stone for Holy Trinity Church, Exmouth, nearly finished by Messrs. R. Wilkins & Son, contractors, Bristol, according to the design of Mr. G. H. Fellowes Prynne, Westminster.

A LARGE clock has just been completed for Menheniot Church, Cornwall, showing the time on three dials, striking

hours and chiming the quarters with Westminster chimes. It is fitted with all the latest improvements, including Lord Grimthorpe's gravity escapement, and was made by Messrs. W. F. Evans & Sons, Soho Clock Factory, Birmingham. The same firm have also just completed another one for Newton Abbot, also one with four dials being erected in Birmingham.

MESSRS. D. G. SOMERVILLE & Co., reinforced concrete experts, of 72 Victoria Street, S.W., have, in addition to a large number of other orders, just signed a contract for the construction and supply of the whole of the reinforced concrete floors and roofs, on their hollow tile system, for the palatial new premises about to be erected for the Norwich Insurance Company at the corner of Piccadilly and St. James's Street, of which an illustration appears in the present number.

THE Commercial Intelligence Branch of the Board of Trade have received from the British Consul at Lyons a copy of a notice published in the *Municipal Gazette* of that city inviting tenders for the construction of a destructor for household refuse, the heat generated by which shall be utilised for motive purposes. The amount of refuse to be destroyed is calculated at 400 tons per day, and the electric energy to be obtained therefrom is to have a tension of about 3,500 volts. Tenders must be received by the Bureau de Travaux Publics, Hôtel de Ville, Lyons, by January 15, but tenderers must put in certificates of their competence for the work not later than the 15th prox.

THE works committee of Dundee Town Council on Monday had under consideration the desirableness of strengthening the hands of the engineer's department with regard to new buildings, and the engineer was instructed to report on the Building Regulations Act.

THE Bethnal Green Borough Council, with a view to erecting a new town hall and municipal buildings, have issued the statutory notice under the Lands Clauses Consolidation Acts for the purpose of acquiring a site at Patriot Square (near the Bethnal Green Museum), containing about 10,843 square feet. The estimated cost of the building is 20,000*l*.

## VARIETIES.

A NEW school is to be erected at Rayleigh, Essex, to accommodate 240 boys.

THE Local Government Board have sanctioned the Heywood education committee's borrowing of 8,595*l*. for the new day school in Hopwood. The sum includes 550*l*. for the site and 450*l*. for the furnishing of the school.

EXTENSIVE alterations, by which the seating accommodation will be practically doubled, are to be carried out to Guiseley parish church. Sir Charles A. Nicholson, of London, is the architect.

THE Local Government Board have issued a return on the operation of the Unemployed Workmen Act for the year ended March 31. In London 28,181 applications were received under the Act and 13,070 entertained, while in the provinces 47,346 applications were entertained out of 58,820 received.

THE public works committee of the Birmingham Corporation are asking the Council to authorise an expenditure of 3,600*l*. to construct an underground convenience in Station Street, at its junction with Hill Street. The conveniences already constructed are in the aggregate self-supporting, showing a profit of over 200*l*. per annum.

THE Bermondsey Borough Council, at their meeting last week, decided to give the finance committee power to engage counsel to defend any action brought against them by the guardians. The Council have refused to meet a precept of the guardians for 20,000*l*. for alterations and additions to the Rotherhithe infirmary, and the latter body have threatened to take legal proceedings!

A SPECIAL meeting of the York City Council on Monday passed a statutory resolution to apply for powers under the Light Railways Act for an order authorising the Council to construct and work, or lease, electric tramways along specified routes throughout the city. It was intimated that when the powers sought for were obtained it was the intention of the tramways committee to take a poll of the citizens as to whether they will have the tramways under municipal control or whether they will lease them to a private company.

80 THE GROVE, WANDSWORTH, S.W.

THE Strathclyde Electricity Supply Co., Ltd., have intimated to the Johnstone Town Council their intention to apply to the Board of Trade for a provisional order to permit them to provide electrical supply to Johnstone for lighting and power. The Corporation will hold an early meeting to consider the situation. Gas at present in Johnstone is 2s. 6d. per 1,000 cubic feet.

ON Monday sixty-eight competitive designs for a municipal secondary school for girls in Rotherham were on exhibition in the town hall. A school had to be designed to accommodate 300 pupils at a cost of 35% per head. Provision was also to be made for an additional 200 pupils at a pro rata cost of 35%. The site of five acres in Middle Lane has already been purchased. Mr. E. R. Robson, of London, is the assessor, and the premiums offered by the governors are—first, 100l.; second, 50l.; and third, 25l. The awards have not been made public.

A SPECIAL committee of the Camberwell Borough Council was appointed in March last to inquire into the "grave charges made against past and present members of the Council" in reference to the purchase of land at Addington Square and Rye Lane at a cost of 38,645l. an acre. The committee, which included the Mayor, having investigated the whole proceedings in connection with the purchases, has unanimously decided that there is no proper justification for the charges.

THE water committee of Glasgow Corporation recommend acceptance of the tender by Messrs. D. Y. Stewart & Co., Ltd., amounting to 14,731l. 13s 9d., for the supply of 2,740 tons of 24-inch cast-iron pipes and special castings required for the second portion of the single and double lines of new mains to be laid from the valve chambers at Gorbals Waterworks to Kennishead Road, at Maxwell Terrace, Thornliebank.

A SCHEME of dock and harbour improvements involving an outlay of 125,000l. is shortly to be undertaken by the North-Eastern Railway Company at Hartlepool. The scheme provides for the conversion of the present Victoria Dock, Hartlepool, into an additional tidal harbour. The present dock gates will be removed and the entrance enlarged to a width of 200 feet. The dock will be deepened so that alongside the coal staithes, at present being built at

a big cost, there will be 24 feet at low-water spring tides. Steamers of great size will be able to run in to fill bunkers or take cargo, and leave at any state of the tide, and it is anticipated that the trade of Hartlepool will benefit greatly.

THE Sunderland distress committee held a special meeting last week, when plans were submitted by the parks committee recommending the construction of a park at the west end of the town at a cost of 15,000l. and a sea wall at Roker at a cost of 5,500l. The schemes have been drawn up to find work for the unemployed, and the committee decided to submit them to Mr. John Burns with a view to obtaining a grant towards the work. A deputation was appointed to see Mr. Burns on the subject. After his decision the plans will come before a special meeting of the Town Council, and it is hoped to have the work begun in a fortnight.

THE Board of Trade correspondent at Cape Town has forwarded a copy of the agenda of a meeting of the Cape Town Corporation on October 24, at which a proposal was adopted by the Council for the construction of a railway to the top of Table Mountain, the concession to be given to an outside body or public company to undertake the same, either with or without the right of providing an hotel. Alternative tenders will be invited for (a) the construction of the railway, (b) the provision of the hotel, or (c) the right both to construct the railway and to provide an hotel in connection therewith. The concession will be granted for a term of 25 years, with the option reserved to the Council of the right to purchase at the expiration of that period.

A LETTER was read at a meeting of the governors of the Glasgow and West of Scotland technical college from the Glasgow Master Painters' Association, recommending the day classes for apprentice painters be held on two days a week during November, December and January. The Association undertook to bear one-half of the salary to be paid to the teacher of the classes, on the understanding that the college would bear the other half. The committee unanimously agreed to recommend the acceptance of the offer of the Association, and appreciation of their action was generally expressed. The chairman remarked on the fact that the Painters' Association had offered to bear one-half of the salary of the teacher, and said this was a precedent in such classes.

NEW PREMISES FOR THE NORWICH UNION LIFE INSURANCE SOCIETY.

NEWDIGATE PLACE, SURREY: THE HALL.

CLYDE STREET SCHOOL, HELENSBURGH, N.B.

CATHEDRAL SERIES.—SOUTHWARK: NORTH CHOIR AMPULATORY.

The Scotch Education Department has had prepared a manual of directions for the cleansing and disinfecting of schools, which represents the expert advice at the service of the Local Government Board. It is explained that the directions are based upon actual experience, take full account of actual difficulties and are the minimum that ought to be enforced by every School Board in the interests of the children. The concluding recommendation is that every school ought to have a cleansing register, in which should be entered the nature of the periodic cleanings, the date when each room is cleaned, and generally such information as may be necessary for the use of the Departmental Inspector or other official who may be charged with the duty of seeing that the cleansing is systematically and efficiently attended to.

The report of the Local Government Board for the year 1906-7 states that since the Board's constitution in 1871 they have sanctioned the borrowing by urban and rural authorities of 171,689,684*l.* An examination of the purposes for which the 6,214,709*l.* sanctioned during 1906 was to be expended shows that 1,698,620*l.* was required in connection with the sewerage of towns and villages, 431,598*l.* for the construction of works of water supply, 156,520*l.* for the rection of dwellings for persons of the labouring class and the demolition of slums, 122,742*l.* for the establishment or enlargement of hospitals, mortuaries and post-mortem rooms, and 141,687*l.* for the provision of baths and wash-houses; 1,488,138*l.* was the anticipated cost of street widenings, the making-up of private streets and the construction of new streets and bridges; 1,161,128*l.* was required for gas and electrical purposes, 18,515*l.* for municipal telephonic systems, 18,962*l.* for purposes of sea defence, and 96,940*l.* for the repayment of existing loans raised for various purposes.

The water committee of the Birmingham Corporation report that the Coventry Corporation Act, 1897, received the royal assent on August 2 last. Under it the Corporation of Birmingham are under legal liability, when the main is laid by Coventry, to deliver to Coventry a quantity of water up to 2,000,000 gallons a day from the Whitacre works. The water, which will be obtained from the river Bourne, will be filtered at Whitacre and delivered into the Coventry main under sufficient pumping head to reach the Coventry reservoir at Coundon. The water will be paid for by meter, with a minimum of 5,000*l.* a year. The Act includes provisions for the protection of Coventry in case at any time the water should fail to reach a reasonable standard of purity, and in that case Coventry has the option of terminating the agreement or taking Welsh water on arbitration terms. In order to comply with the provisions of the Act, it is necessary that the filter beds at Whitacre shall be thoroughly overhauled and remade, and the committee have given instructions for this work to be put in hand forthwith.

Mr. JOHN DOUGLAS, road surveyor to the Turriff district committee of the Aberdeenshire County Council, was charged at a Justice of the Peace Court at Aberdeen with contravening the Road Act, by permitting eighteen heaps of road metal to remain on the public road between Huntly and Turriff from August 21 to October 15—a longer period than was necessary for the spreading of the metal. It was also mentioned in the charge that Dr. Chapman, Turriff, had met with an accident while driving on the night of October 13, in consequence of his gig running into one of the heaps of stones at the roadside. The accused denied the charge, and from lengthy evidence led, it was brought out that the night on which the accident occurred was very dark and that Dr. Chapman's gig was upset. Mr. Douglas explained that the spreading of the metal was delayed more than usual this year as a result of the late harvest operations, which took up all the available labour. A penalty of 2*l.* with 3*l.* expenses was imposed. The Justices gave it as their opinion that there had been undue delay in spreading the metal on this occasion, and also that the authorities ought to provide recesses for road metal.

"The NORWICH UNION has an ample variety of Schemes to meet the differing circumstances and predilections of the public, and it knows how to present them in a popular form."—*Post Magazine*.

Write for particulars to the Secretary, **NORWICH UNION LIFE OFFICE, NORWICH.**

At a meeting of Edinburgh, Leith and District Trades' Council held in Edinburgh, attention was drawn to a dispute in connection with the wages of joiners working at the exhibition. The chairman said the contractor had dismissed fifteen men who were underpaid, and he was not taking the objection lying down, since he had discharged two members of the Joiners' Society. A resolution was unanimously adopted that the executive should take drastic measures to compel the contractor to implement the conditions of his contract, and expressing the dissatisfaction of the Council with the action of the contractor in discharging officials and members of the Joiners' Society. A rider was adopted intimating that the Trades Council would advertise in the papers a warning to working men not to purchase season tickets for the exhibition until they were satisfied as to the fair conditions of labour at all works in connection with the construction of exhibition buildings.

MR. EDMOND L. O'BRIEN, Local Government inspector, opened an inquiry in the Kilrush Union workhouse relative to applications by the Rural District Council for the construction of labourers' cottages. It is sought to have 152 cottages erected, and to provide 39 plots of land without cottages at an entire cost of 28,000*l.* The Clerk: The estimated outlay in respect of each cottage was 182*l.* The Inspector said the Local Government Board thought that cottages should be built for 180*l.* each, and he would suggest that the cost of fencing, viz. 12*l.* 15*s.*, be reduced so as to bring the outlay down to the sum he had mentioned. In other parts of the country where labour was dearer it had been possible to do this. It was calculated that the carrying out of the present scheme as regarded the cottages would mean an annual loss on the rates of 118*l.* 19*s.*, to which must be added cost of repairs and insurance.

In his annual report Mr. A. James, borough surveyor a Kidderminster, states that satisfactory results have attended the experiments begun last year by placing tar on sections of the Birmingham Road to prevent dust. Considerably less dust arose from the portions of the road tarred than from the parts of the road regularly watered. In the winter months comparatively little scavenging on the tarred road was necessary, the roadway being nearly always free from mud, with the result that there was a considerable saving in the cost of scavenging

and the durability of the road was prolonged. In the past year he had made further tests in three different ways:—(1) Roads having good surfaces were tar-painted only; (2) where roads needed repairs the stone was tarred before it was put on, well rolled, and when consolidated hot tar was brushed over the surface; (3) where roads needed repairs stone was put down dry, thoroughly rolled till consolidated, after which a thick layer of well-tarred screenings was spread over the surface and rolled, being finished off with a coat of hot tar. The result in each case was perfectly satisfactory, reducing very considerably the dust and putting a splendid surface on the road, the top presenting the appearance of asphalt. In wet weather the roads were perfectly clean.

### MR. EDISON'S CONCRETE HOUSE.

IN the course of a letter, Mr. T. A. Edison gives the following further account of the proposed experiment in the manufacture of cheap house:—I now have a model, one-fourth the size of the house, designed by the New York architects. This winter I shall construct the iron moulds and devise machinery whereby a full-sized house can be cast in twelve hours after the moulds are in position. At the end of six days the iron moulds are removed, and the house will be complete, including stairs, partitions, mantels, bath, &c., and after drying six days will probably be ready for occupancy. To build this house for 1,000 dols. it is essential that it be erected on sandy soil, as the material excavated for the cellar is all that is required to build the house except, of course, the cement. The cost of the iron moulds will be about 25,000 dols., and the cost of the other machinery about 15,000 dols. From this outfit an unlimited number of houses can be erected. It is probable that companies will be formed who will have several moulds, each of a different design, and will go actively into business. I have not gone into this with the idea of making money from it, and will be glad to license reputable parties to make moulds and erect houses without any payment on account of patents, the only restriction being that the designs of the houses be satisfactory to me and that they shall use good material.

**SANITARY APPLIANCES.**

A LECTURE on "The Comparative Advantages of Syphonic Discharge *versus* Flush-down or Wash-down Closets" was delivered by Mr. W. Jennings (Messrs. G. Jennings, Ltd.) in the South London Art Gallery before the students of the Camberwell School of Arts and Crafts and local builders. The chair was taken by Professor Henry Adams.

After some preliminary remarks, the lecturer said he might be accused (possibly rightly so) of giving undue preference to the inventions and productions of the firm with whom he had for so many years been connected, but even with this risk he preferred to speak upon the merits of those appliances with which he was conversant, rather than to embark on a criticism of the productions of other manufacturers, with which they were probably at least as well acquainted and informed.

*Joints between Metal, Soil and Waste Pipes and Stoneware Drains.*

The placement of all vertical soil and waste pipes on the outside surface of external walls of buildings has been universally conceded to be a wise and proper procedure, as all joints being exposed to view can be periodically examined and tested. Moreover, if by any mischance a joint should be defective or unsound, the foul air is far less likely to escape into the building and prove deleterious to health than where waste pipes are fixed inside buildings. Although much has been done, and many improvements have been introduced in the manner of jointing pipes, one of the most important connections of all in a system of drains appears to have been almost entirely overlooked. Sanitary engineers are contented to joint up vertical lead or iron waste pipes to stoneware horizontal drains with nothing better than a jointing material of Portland cement, which admittedly has no affinity for or natural adhesion to metal, with the obvious result that as soon as the joint sets—*i.e.* the cement becomes dry and hard—it contracts away from the metal pipe, leaving an aperture for the escape of foul air and sewage immediately below the ground-floor level, and so shallow a depth as to be invariably a source of great danger to health. It is no exaggeration to state that in nearly 50 per cent. of houses which are tested the joint

referred to is found defective. The trouble is, moreover, increased by the inevitable settlements (even though slight) which occur in connection with new work, as well as by the contraction and expansion of the metal soil or waste-pipes, due to climatic changes and other causes, resulting in the fracture of the cement and the pulling asunder of the metal and stoneware pipes. Messrs. George Jennings have given careful consideration to a means of effecting a permanent improvement in the method of connecting metal waste-pipes to stoneware drains, resulting in the designing and introduction of a novel and simple form of joint secured by two bolts and clips, by which the lead soil pipe is attached by an ordinary wiped plumbers' solder joint to a brass thimble, the latter being securely fixed in the socket of the stoneware socketed bend or drain pipe by means of two incorrodible metal bolts screwed into a metal ring on the back of the earthenware socket, thus affording an absolutely sound and permanently dependable connection.

A slightly modified pattern is also supplied for connecting iron soil and waste pipes to stoneware drains. The cost is small, and should form no obstacle to its general adoption by all who are desirous of obtaining a reliable joint and a security from leakages which it is seemingly impossible to obtain with any form of cement joint.

*Syphonic Water-closets.*

There are a great many varieties of wash-down water-closets, but the fundamental principle or design is more or less alike, being based on the cottage hopper basin and trap, the formation of which necessarily retains but a small quantity of water sufficient only to form a shallow seal or trap between the apartment and the drain. The clearance of the basin is mainly dependent upon the perfect making and burning of the flushing rim, and the force of the discharge from the flushing cistern, which should be of not less than three gallons capacity to insure removal of the contents of the basin. In action the trap of a wash-down closet is never emptied, the water merely overflowing into the drain in equal quantity to that admitted into the basin through the flushing rim; consequently the flushing of the drain is restricted to the capacity of the down service pipe from the cistern, usually  $1\frac{1}{2}$ -inch diameter and equivalent

to about one-seventh of the area of a 4-inch drain; furthermore, the water, &c., discharged through the trap of the closet is obstructed in its escape by the atmospheric pressure in the drain. The shallow seal of water retained in the trap is so easily susceptible to variations of increased air pressure from the drain, as well as to syphonage, "waving out" and evaporation, as to form but an uncertain and unreliable barrier or safeguard against drain gases escaping into the apartment. The absence of a body of water in the basin leaves a large dry surface exposed for the adhesion of excrementitious matter which it is difficult to dislodge; whilst foul emanations freely escape and contaminate the air. The efficient working of wash-down closets, being entirely dependent upon the force and bulk of the discharge from the flushing cistern, inevitably creates noise during action, which is frequently a great source of objection. In many instances it is impracticable to place the flushing cistern immediately above the closet on account of a window being situated in the back wall, and in such cases the flushing cistern has necessarily to be fixed on the side wall, involving bends and twists in the down service pipe, which seriously impede the flush and reduces its efficient power to an extent which it is generally impossible to compensate for by fixing the cisterns at a high level, on account of the comparative lowness of ceilings in water-closet apartments. The keen competition amongst manufacturers to place on the market closets at the lowest possible price obviously tends to discourage proper care in selection of only perfectly formed and "fired" pieces of earthenware, and the rejection of imperfectly made flushing rims and fans. A further frequent source of trouble and difficulty is caused by want of information as to the water pressure under which the flushing cisterns will be fixed, resulting in ball valves made for low pressure being fixed on main high pressure, which they are not calculated to resist or close against, thus causing overflows to take place, involving waste of water, inconvenience and annoyance. In attempting to remedy the difficulty, the workman, from want of knowledge as to cause and effect, will usually bend the stem of the ball valve downwards so as to submerge the ball, and thereby increase the flotative power, and cause the ball valve to close against the water pressure;

this course is occasionally successful in preventing the overflow and waste of water, but results in the cistern being only partially filled, and in a totally insufficient flush to efficiently wash and cleanse the water-closet basin. The trouble is increased by water companies' regulations requiring that ball valves shall be supplied capable of withstanding a water pressure (in some cases) of 100 lbs. per square inch. Manufacturers have no option but to comply with these regulations, and the cisterns after having been successfully tested on high pressures at the waterworks testing offices, are in numerous instances fixed under pressures of only a few pounds per square inch, the result being that the ball valves, being made with a very small waterway to resist the waterworks severe test, admit the water at such a slow rate that a considerable time is occupied in refilling the cisterns after discharge. This in cases of crowded and much-frequented retiring-rooms is a source of great inconvenience and results in inadequate flushing. This trouble could be easily obviated by proper information being furnished to the manufacturers when orders are placed as to the pressure the cisterns will be fixed under, and water companies agreeing to test the ball-valves up to the pressure for which they are constructed and intended to work.

(To be continued.)

PLANS are to be deposited this month for a large steamer pier and harbour works in Gott Bay, Tiree, Argyre, also for another at Walls, Vaila Harbour, Shetland. Mr. Woulfe Brennan, Glasgow and Oban, is engineer for both schemes.

H. M. CONSUL-GENERAL at Shanghai (Sir Pelham Warren, K.C.M.G.) has forwarded particulars relative to an invitation issued by the Municipal Council of the French Concession at Shanghai, for designs and plans for the construction of various municipal buildings. The competition closes on February 15 next. Designs, in sealed envelopes, should be addressed to "Monsieur le Président du Conseil d'Administration Municipale de la Concession Française, Shanghai." The conditions of the competition, together with a plan of the site of the proposed buildings, may be seen by British firms at the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, London, E.C.

## REINFORCEMENT BY INDENTED BARS.

VISITORS to the last Building Exhibition will remember how at the stall of the company the patent indented steel bars were used in order to sustain loads. The wide spans and varying curves in which they were bent would by itself be sufficient to suggest the lightness combined with rigidity which are among their qualities. The photographs and models which were near indicated

theory on which the system is based, and tables which will enable an architect to work out for his own satisfaction the particular form which he wishes to adopt. In the Waldorf Hotel, in Rawson's immense factory in Leicester, in the *Morning Post* building, in the Albert Mills, South Reddish, the Royal Insurance Office, Piccadilly, the Downside reservoir, the Cleethorpes water tower, the stadium at Shepherd's Bush and a dock on the Clyde, we have works on a grand scale. But if of lesser extent the

one of the immense works in which the system was employed. The description which the company have given corresponds in a large measure with the stall. We see, besides, illustrations of great works in which the system has been utilised, not only in the United States but in this country, but also a full explanation of the

work of the Shildon schools for the Durham County Council is no less interesting, for by means of the system the foundations are guarded against any subsidences which may arise from the unworked coal seams beneath the site. That is a contingency to which new buildings in many parts of England are liable, and it is well to know how safety can

J. B. ORR & CO., Ltd.,  
CHARLTON, LONDON, S.E.

Marks, M.P., proposed "The Society of British Gas Industries," and said he was very pleased to submit the toast, because the Society was associated with the well-being of the whole community. Then again, one of the objects of the Society was the making of clean trade. He had just returned from America and had visited among other cities Chicago, Milwaukee and Pittsburg. His impression was that if the methods of trading in America were more legitimate that country would not now be involved in a financial crisis. The Society represented the big gas industries and it was

of "The Institute of Gas Engineers and Kindred Associations" was proposed by Mr. F. J. West. The president of the Institute (Mr. W. Doig Gibb), in response, said he felt that both the Institute and the Society could mutually help each other, and he was hopeful that in the course of time general clauses would be drafted between the two bodies which should be equally fair to both. Mr. J. W. Helps and Mr. Joseph Davis also replied. Mr. J. W. Broadhead submitted "The Visitors," and said the Society would shortly hold a conference with architects, and he was

SHILDON SCHOOLS.

right therefore in upholding purity in trade and fair dealing. The President in responding said the co-operation between the two distinct bodies, the Society of British Gas Industries and the Gas Institution, had already been favourable to both, and one successful result of the combination was evidenced in the Gas Exhibition at Manchester. The society had at heart the welfare of the people, and his successor as president, Sir George Livesey, could be relied upon to advance the object they had in view. The toast

sanguine that the outcome of their deliberations would be that more attention would be paid by architects to gas lighting and heating than they had done in the past. Some few years back electric-light fittings lent themselves perhaps to more ornamental and decorative treatment than gas brackets, but nowadays the speaker believed more invention has placed gas on a par with electricity. Mr. Frank Vallance, in the first response to the toast, said the title of the Society appealed to him, for it represented a

very great industry and a large amount of capital. Mr. Broadhead hoped that architects would take more into account the use of gas as against electricity in domestic buildings. The speaker ventured to predict that gas would hold its own, for it had been his experience to find electricity superseded by gas. He knew of instances where electric installations had been taken out of a building and gas reinstated; this occurred particularly in places of worship and small shops. Then again, for street lighting the incandescent gas burner was far preferable to the electric light. He thought therefore a bright prospect awaited the manufactures represented by the Society. One fact which appeared rather strange to him, and he could not account for it, was that with the advent of electric power and light stations in tow the output of gas still went on increasing. Mr. H. D. Searles-Wood, who also responded to the toast, said the Royal Sanitary Institute were not quite satisfied with gas fires as at present constructed. The manufacturers should look to this, for although progress had been made in the designing of gas pendants and brackets, such progress was far ahead of the improvements to fires. Speaking as an architect, no gas designed fire ever appealed to him. He was strongly in favour of heating by gas, but the fires must be improved in order to do away with the risk of contamination of the air.

Commander Caborne, C.B. (member of Council of the Smoke Nuisance Abatement Society), said they could not abolish fog in London, but it would be possible to have clean fog if the barbarous fashion of burning smoky coal in grates was substituted by gas fires. The toast of "The Press and the President" followed.

#### CONCRETE BUILDING.

At a meeting of the Liverpool Engineering Society, the value of reinforced concrete for building purposes was discussed, Mr. M. Kahn reading a paper on the subject. There was a large attendance, which included representatives of the Liverpool Architectural Society. Mr. Kahn said that in the matter of efficiency reinforced concrete is

permanent and proof against deteriorations to which other materials are subject, such as the rusting of steel, the rotting of wood and the decaying of stonework. It is unaffected by atmospheric action, it is absolutely fireproof, and its strength increases with age; while it makes possible a rapidity of erection not attainable with other methods of construction. On the point of economy, Mr. Kahn discussed the circumstances under which it is either cheaper or dearer than other materials, and suggested that if reinforced concrete is not in some instances the "cheapest" method of construction, it is the most economical when all things are taken into consideration. Mr. Kahn considered at length the strain-bearing qualities of the material, and argued that its successful use depended merely on the proper selection of materials, their handling and the supervision of the construction. Illustrative failures of concrete structures were analysed as to their causes, and Mr. Kahn insisted that the best design and the best method of construction when placed in the hands of careless or ignorant men will result in disaster. On the fire-resisting qualities of reinforced concrete, Mr. Kahn admitted that ballast concrete was often considered unsatisfactory, but suggested such cases were due to the ballast being uncrushed, and that large stones when heated will fly apart. If the ballast used in the test, he argued, had been crushed before being incorporated with the concrete, the fire-resisting result would have been satisfactory, as was a test made by Mr. Kahn for the New York City Fire Department in 1904, when crushed ballast concrete was used.

#### LESLIE WALKER ALARM AT THE GLASGOW UNIVERSITY.

A DEMONSTRATION of the efficacy of the Leslie Walker fire detectors was given last week at the University of Glasgow. The north front of the College buildings, which embraces the valuable library and museum, has just been equipped with these appliances, and a large company, which included Sir William and Lady Bilsland, assembled to witness the display. The advantage claimed for this system of fire alarm is that it acts on the slightest abnormal rise of temperature. The instrument consists of a sealed glass

tube under vacuum partially filled with mercury; a main bulb filled with mercury, exposing a large surface to the atmosphere; a platinum wire which is fused into the tube containing the mercury and connected to a terminal; and platinum wires fused into the normally empty contact tube and also connected with terminals. The appliances in the library of the University, where the demonstration was given, are fixed to the ceiling, and are connected by wires to an indicator board, with bells and batteries, in the office of the master of works, and also in his house. The effect of abnormal temperature, such as would result from an outbreak of fire, is to expand the mercury and force it up the contact tube, thus setting the alarm bells in operation. If the fire is not instantly extinguished a second alarm known as the danger call is given by the mercury rising still higher. Professor Gray having explained the instrument, an interesting experiment was made. On the floor of the room, says the *Glasgow Herald*, was placed a wire crate containing a quantity of paper, to which a light was applied. The heat rising from the fire put the instrument in operation in twenty seconds, bells ringing simultaneously in the master of works' office and house and also in the library, a connection having been made there in order to demonstrate the working of the alarm, to those present. By means of the indicators placed in the office the seat of the "outbreak" was immediately located. A description of the instrument, with illustrative diagrams, was subsequently given in one of the classrooms of the College.

#### IRON AND STEEL MANUFACTURE.

On Saturday, at a meeting in connection with the Staffordshire Iron and Steel Institute, held at the Institute, Dudley, under the presidency of Mr. R. Buchanan, a paper was read by Mr. J. Ernst Fletcher, M.I.Mech.E., on "The Influence of Gases on the Structure of Cast-Iron and Steel." Mr. Fletcher remarked, says the *Birmingham Daily Post*, that steel, iron and all other metals converted from the solid to the liquid state by the application of heat contained, when liquid, gases in solution to a greater or lesser extent. These gases were driven out more or less

completely when the liquid metal passed to the solid condition. Three aids to such gas escape were used in practice, namely, rapid chilling, which, by causing molecular contraction, prevented the inclusion of gas bubbles between adjacent crystals; very slow cooling of the liquid mass, whereby the gases could rise to the surface and thus leave a gas free liquid; and rapid chilling, aided by compression, which again brought the adjacent crystals of the solidifying mass into such close contact that gas inclusion was impossible. Professor Turner had suggested that the possible explanation of the difference in hardness and tensile strength in basic and acid steels was connected with gaseous influence, and this would, on closer investigation, appear to be the true explanation. Basic steel as was well known, was softer than acid steel of similar carbon content. Silicide of iron had a hardening effect on the structure of steel, and this fact, combined with the freedom of gas porosity, explained why acid steel was harder than basic steel. As in the study of the influence of silicon on the structure of acid steel, so in the case of cast-iron, silicon and manganese played an important part in connection with the escape of gases during solidification. Experience in manganese-steel manufacture confirmed the statement that manganese hastened the solidification of cast-iron and steel containing higher manganese content. Thus manganese steel cast at a high temperature into chill moulds was found to solidify almost instantaneously when the solidifying point was reached; the gases escaped rapidly and left marked zones of weakness along which the ingot could readily be broken. The higher the temperature at which iron or steel was cast, the more gases were absorbed, hence the need for extra feeding and efficient venting of the moulds. In his opinion, it was clear that the gases set free during the solidification of the iron (ferrite) in the iron carbon alloys, cast-iron and steel, played a much more important part in the structure of such alloys than was generally allowed. It would not be surprising if in the hands of skilled metallurgists, possessed of the necessary apparatus, it was proved that the "contraction" or shrinkage of metal was almost entirely due to the driving off of gases set free during solidification. The higher the combined carbon content the greater was the shrinkage. If, as appeared likely, carbon content was coincident with

Manufacturers of the "12-hours" Boiler, and  
Heating Apparatus of all descriptions. —

freedom from gas inclusion, then it would seem that shrinkage and gas escape during solidification were intimately connected. The paper was illustrated by diagrams and micrographs. Some discussion followed, and a vote of thanks to Mr. Fletcher concluded the proceedings.

### PROPPER'S SLAB PARTITION.

A NEW partition known as Propper's, which has been patented in all countries, has been introduced for use in

England by Messrs. Charles Ingram & Co., 26 Mark Lane, E.C. The slabs have the shape of a cross of equal arms. In consequence, the slabs not merely adjoin

along a straight line of contact, but they grip each other at right angles and interlock. Additional cohesion is given by corresponding strong notches and grooves provided in the angles and along the arms of the slabs, so that a partition or wall erected with them is perfectly strong and rigid in any direction. They have been made in gypsum moulded in metal forms protected by patent, but any material or composition capable of producing a perfectly accurate and smooth slab may be used. The partition will naturally possess all the qualities inherent to the material used, such as being fireproof, &c. A level basis is the only essential required for the erection of a Propper slab partition, and, if necessary, a ground joist of oak will serve the purpose. The putting together of the wall is of the simplest method. The door frames, which must have the same depth as the partition, are nailed against the latter. The fixing of the Propper-slab partition against walls or ceilings is effected in the usual manner. When two partitions meet the arms of the crosses dovetail. Should any of the joints of the partition show a slight unevenness it can easily be removed by scraping, and a perfectly even surface will be obtained that can be papered immediately.

### THE ZOOLOGICAL GARDENS.

WHAT will undoubtedly prove a great attraction to this popular place of amusement and education is now being carried out. His Majesty's Commissioners of Works have granted the use of an additional piece of land to the extent of nearly three acres, and the workmen are already at work laying it out, dividing it up into several yards, where various sheds are to be erected, so that the public using Regent's Park will be enabled to see the deer, which are to be transferred to this position. Within this strip of land there are several shrubberies, which will be made into picturesque pieces of forest, and it is contemplated removing the bears to this position. "The Zoo," as it is commonly called, has been to all a pleasurable and instructive place to visit, and any improvements thereto will be sure to be of interest to most of us.

## No. 2 "SIGNET" Combined Range and Sitting-Room Grate

Very suitable for Small Houses, Cottages, Flats, &c. (Patented).

Combines in itself in a practical and efficient manner the essential features of a Cooking Range and Sitting-room Grate.

ATTENTION is specially directed to the "Signet" Patent Combined Canopy and Damper with which all these Grates are fitted. It will be found to be of great use as a FUEL ECONOMISER by adjusting it so as just to permit of the smoke getting away, but no more, thus preventing the escape of warm air into the chimney, and giving the radiating power of the Grate its full value as a means of warming the apartment; also as a baffle against draughts, &c. IT IS THE ONLY GRATE OF ITS KIND POSSESSING THIS IMPORTANT FEATURE.

Has been THOROUGHLY TESTED and has given UNIVERSAL SATISFACTION. This Grate can only be supplied through Builders' Merchants, Ironmongers &c. Copies of unsolicited testimonials and further particulars may be had from the Makers,

**NOTICE TO ADVERTISERS.**

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

**EDITORIAL NOTICES.**

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

**TENDERS, ETC.**

\* \* As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

**COMPETITIONS OPEN.**

DURHAM.—Dec. 21.—For the County Council of Durham. Names of architects willing to submit competitive plans for training college for teachers. A selection of ten names will be made. An assessor will be appointed to adjudicate and select three designs. Premiums 250l., 100l. and 50l. respectively. J. A. L. Robson, secretary for higher education, Shire Hall, Durham.

## TRADE NOTES.

MESSRS. PEMBERTON, ARBER & Co., of Gray's Inn Passage, Holborn, the proprietors of the "Sesame" doors, have appointed Messrs. W. & F. Brown & Co., cabinet-makers and high-class decorators, of Eastgate Row, Chester, as agents for the sale of their "Sesame" doors in the town of Chester and surrounding district. Messrs. John Taylor & Sons, Edinburgh, Ltd., high-class furnishers and decorators, of 110 Princes Street, Edinburgh, have also been appointed agents for Edinburgh and district.

THE United Kingdom Fireproofing Company, Ltd., 47 Victoria Street, S.W., have secured the contracts for the whole of the steelwork, fireproof floors, &c., for the new telephone exchanges at Glasgow and Dalston; these are in addition to the large telephone exchange at Manchester which they are at present carrying out.

## VARIETIES.

THE erection of a theatre is about to be commenced on a site near Wimbledon station. The new building, which will accommodate over 3,000 people, will be opened in August 1908.

It has been reported to the local authority at Chapel-en-le-Frith that out of thirty-four road bridges in the district no more than three can be said to be in good condition, while twenty require rebuilding or extensive repair and eleven ordinary repairs. Some of the bridges are admitted to be in a dangerous condition.

OWING to the extraordinary development of the parish of Cathcart, the School Board have had in recent years to erect not fewer than three new schools. It was recently agreed to build another one to meet the requirements of the Cathcart district. Accommodation is to be provided for 1,200 scholars.

THE proposal to increase the Australian duty on roofing slates exported to that country from 15 to 25 per cent. is exciting much anxiety among the quarry owners of North Wales, who export enormous quantities of slate to Australia. They have decided to petition the President of the Board of Trade to endeavour to secure a reduction in the tariff.

THE electricity supply committee of the Stepney Borough Council recommend "That the main tender, amounting to the sum of 28,140*l.*, of Messrs. Willans & Robinson, for the complete equipment of the electrical generating portion of the station plant be accepted, conditionally upon the consent of the London County Council being obtained to the necessary loans."

At an inquiry held on Tuesday at the Guildhall, York, into an application by the City Council to borrow 5,400*l.* for city improvements, it was stated that the city was already three-quarters of a million in debt and had an overdraft at the bank of 50,000*l.* The Local Government Board inspector complained that York had a very bad reputation for spending money first and asking afterwards for leave to borrow it. The Lord Mayor claimed that York was no worse than any other city in that respect. The Board's regulations could not be carried out in their entirety. The inspector retorted that other cities managed to comply with them.

# THE "U.K." REINFORCED CONCRETE FLOORS

DESIGN FOR NEW COUNTY HALL, LONDON.

THE Wednesbury Town Council on Monday considered a statement from the mining engineer with regard to the existence of a thick coal seam underneath the new public library, and that it was proposed to take steps to insure the safety of the building. Some of the coal is not solid as a result of its having been previously worked. It is, however, proposed to provide concrete and sand dams.

The housing committee of the Liverpool Corporation has had before it a statement by the city treasurer and controller as to the financial results of demolition and housing in Liverpool. The approximate cost of these operations, after allowing for sums realised by the sales of surplus land, to December 31, 1906, was 838,550*l.* 9*s.* 6*d.*, being 486,397*l.* 17*s.* 2*d.* for housing and 352,152*l.* 12*s.* 4*d.* for demolition.

THE Derwent Valley Water Board have accepted the tender of Mr. John Mackay, of Carlisle, for the construction, completion and maintenance of section "E" of the Derwent aqueduct, extending from the end of one branch of section "D," at a point near Belper, to Sawley on the Leicester and Derby pipe line, and from the end of another branch of section "D," at a point near Ridgway House, at Heage, to Langle Mill on the Nottingham pipe line.

DURING this week there has been on view at the premises of Messrs. Geo. Trollope & Sons and Colls & Sons, Ltd., in West Halkin Street, Belgrave Square, some very fine carving in limetree wood (Grinling Gibbons style) for a ceiling in Mr. Henry Phipps's mansion in New York, from the designs of Mr. Geo. A. Crawley, of that city. The central band of ornament is carved from solid wood 6 inches thick, while the four large cartouches are carved from solid wood 12 inches thick, and the composition is a mixture of fruit and flowers, &c. The work, which we had the pleasure of inspecting by invitation, was executed at the workshops of the firm in question in Grosvenor Road, the modelling and carving having been done by Mr. F. Rogers.

MR. W. A. DUCAT held an inquiry at the Manchester town hall on the 3rd inst., on behalf of the Local Government Board, into the City Council's application for sanction to borrow various sums of money. The Council want to borrow 10,921*l.* for works of private street improvement, 4,000*l.* for the purpose of the paving and highways yard in Factory Lane, Blackley, and 8,700*l.* for works of street improvement in Cemetery Road and Clayton Vale Lane, Newton Heath, and Corporation Street, Manchester.

THE Salford Board of Guardians have agreed to let the contract for the redrainage of the Hope Hospital to Messrs. J. Gerrard & Sons, of Swinton, whose estimate was 5,990*l.* The drainage system has been examined by the medical officer of health for the borough and condemned, and members of the Board stated that the health of the nurses had been affected by the unsatisfactory sanitation. Fourteen tenders were considered, the highest being 8,598*l.* The lowest tender was accepted.

IN Belfast it was reported on Saturday that the Great Northern Railway Company intend at an early date to transfer their large locomotive works from the seaport town of Dundalk, county Louth, to Belfast. The directors of the company have had the scheme under consideration for some time. The site which has been acquired in Belfast is in the vicinity of the Bog Meadows, and the contemplated works will cover a much larger area than the present engine shops in Dundalk. The transfer will involve a heavy loss to Dundalk, as about 600 men are employed in the works, while a sum of 30,000*l.* is paid in wages annually.

THE finance committee of the Birmingham Corporation have negotiated with the Prudential Assurance Company for the advance of loans of 39,568*l.* and 64,271*l.* on electric supply account, and a loan of 100,000*l.* on tramways account, and the Company have agreed to lend the money on the following terms:—The amount to be paid over in December, 1907. The loan of 39,568*l.* to be repayable in twenty-five years by fifty half-yearly instalments, and the loan of 64,271*l.* to be repayable in twenty-one years by half-yearly instalments. The loan of 100,000*l.* to be repayable in twenty-five years by half-yearly instalments. Interest to be at the rate of 3*l.* 18*s.* 9*d.* per cent. per annum.

tons.

The Avery Self-contained Truck Weighbridge.

& T. AVERY, Ltd., Soho Foundry, BIRMINGHAM.

At Dundee a start is to be made immediately with the initial work connected with the erection of the new electric generating station at the east end of the harbour. The electricity committee of the Town Council have agreed to accept the offer of Messrs. Robert M'Alpine & Sons, Glasgow, for the construction of the foundations for the station, the pump-room and river works in reinforced concrete on the Coignet system. The cost will be about 6,000*l*. A large proportion of the expense, owing to the nature of the site, will be incurred owing to the necessity of reinforced concrete piles. The work will be proceeded with forthwith, and the city engineer is busily engaged preparing specifications and drawings for the superstructure.

THE Market Harborough Urban District Council have adopted an original method of disposing of their ashbin refuse, according to the *Manchester Guardian*. The new plan is to pulverise the refuse, saturate it with tar and pitch, and then press it into briquettes. The new fuel, to which the name of "coalesine" has been given, burns freely in the boiler furnace or open grate without an excess of smoke, and leaves a soft, reddish, friable ash. Its calorific value is stated to be 3.33 lbs. of water evaporated per pound of fuel burnt, and it is estimated that the total cost of producing the briquettes, including power, labour, loan instalments and interest, does not largely exceed 4*s*. per ton, which would appear to leave a fairly good margin of profit.

At the last meeting of the Bolton waterworks committee correspondence was read between Messrs. Best & Sons, Ltd., and the town clerk as to the standard rate of wages clause proposed to be inserted in the contract No. 1 for the construction of the Delph reservoir, and it was resolved that the following proviso be added:—"That inasmuch as there is no navvies' union in existence in the district of Turton at the date of this contract, the contractors shall not, in the event of a navvies' union coming into existence during the continuance of this contract, be necessarily bound to recognise such union." It was further resolved that the following be inserted in the contract with Messrs. Best & Co., Ltd.:—"If any workman considers himself incapable, through age or infirmity, only of earning the wages specified by the standard rate of wages clause of this agreement to be paid, he may be paid such wage as may from time to time be agreed upon in writing between

the contractors and the President for the time being of the Bolton Trades Council, and, failing such agreement, as may be fixed by the Mayor for the time being of the borough of Bolton aforesaid."

### VOLCANIC ASH CEMENT.

ACCORDING to a report from Consul G. H. Scidmore, at Nagasaki, the Kyushu Kazanbai (volcanic ashes) Company, which is composed of prominent business men of Nagasaki is conducting a very successful business. It has been decided to construct a factory near Yobiko, and about 10,000 *tsubo* (about eight acres) of land was recently acquired by the company for the purpose. The Saga-ken authorities have been applied to for permission to construct a light railway between Uchiage, where the first factory is situated, and Yobiko, a small port from whence the product of both factories could be shipped. When these undertakings are completed, the annual output is estimated at 700,000 bales.

At present the ashes, which are used as a substitute for cement, are supplied to the Mitsu Bishi and Kawasaki Dockyards, the Sasebo Naval Yard and the Wakamatsu Iron Foundry. Quantities have also been exported to Korea, North China, Shanghai and Formosa, and the demand is rapidly increasing. Forty thousand bales were recently supplied to the Sasebo naval authorities, and a contract has been made for the supply of 60,000 bales to be used in the harbour works at Keelung. The ashes are much cheaper than cement and almost as effective; sometimes the ashes and cement are used together most advantageously. The company paid a dividend of 9 per cent. for the first half-year on a capital of 200,000 yen (99,600 *dols*.).

Mr. Scidmore adds that he is informed by a gentleman connected with building work at Nagasaki that this cement is composed of volcanic ashes, to which are added sand and Portland cement. The proportions of this mixture he has not been able to ascertain.

THE Doncaster Corporation have decided to promote a Bill in the next session of Parliament to enable them to construct a bridge over the Marshgate crossing, and also to construct new roads and tramways. The estimated cost of the scheme is 100,000*l*.

## CABOT'S INSULATING AND SOUND-DEADENING QUILT

PREVENTS THE TRANSMISSION OF SOUND through walls and floors by absorbing and breaking up the sound waves. No other Deafener does this.

KEEPS OUT HEAT OR COLD exactly as do the feathers of a bird; providing innumerable minute dead-air spaces, giving highest insulating power. Will save enough fuel in a single Winter to pay for itself. Keeps a room warm in Winter, cool in Summer. DECAY, MOTH, AND VERMIN-PROOF, AND UNINFLAMMABLE.

Scientific investigation has proved that for HEAT INSULATION or SOUND-DEADENING the highest degree of efficiency, with economy in cost and extreme durability, has been attained by CABOT'S QUILT

## ARTHUR L. GIBSON & COMPANY,

19, 20 & 21 TOWER STREET, UPPER SAINT MARTIN'S LANE, LONDON, W.C

## A CONCRETE MAP.

EARLY in January, 1907, the authorities at Washington decided to construct at the Jamestown Exposition a large relief map which should show the Panama Canal as finally planned, together with the topography of the surrounding country. After some correspondence Mr. Charles H. Johnson was selected to undertake the actual construction, finally receiving orders early in March to proceed to the Exposition via Washington. The office end of the work was in charge of Mr. Ralph Whitman, then on the staff of the Isthmian Canal Commission, who had collated all available information in regard to the topography and placed it on a large map of the route of the canal, scale 1=50,000, taken from the report of the Commission of 1905, and mounted on cloth.

On arriving at the site of the work on March 11, says the *Engineering Record*, the space allotted to the model was found to be covered with contractors' shanties, one being in the process of demolition. The labour situation was bad, wages for common labour being 1 dol. 75 cents for eight hours, and the labour very scarce and inefficient. Cement finishers were almost impossible to obtain and wanted 50 cents an hour. Stone and cement for the concrete were brought from one of the large contracting firms doing work at the grounds and were taken from cars on a track alongside the work, and was obtained from the beach about 200 feet away.

After looking the situation over the map was laid out, the dimensions being 122 feet east and west and 50 feet north and south, its axis corresponding with the centre lines of two of the Government exhibit buildings, its horizontal scale being 1=2,000. The ground at the site was level; excavation showed, first, 1 foot of top soil mixed with roots, then about 3 feet of sandy clay, then 18 inches of sand, then clay at ground-water level. It was decided to make sea-level on the map about 2 feet below the natural surface of the ground, so that by grading up the spoil to form a raised walk around the map visitors would be sufficiently above it to see over the tops of the hills.

Some Greeks were put to work stripping off top soil and excavating for the Atlantic Ocean. A search for cement finishers produced a couple of negro helpers or second

hands, who were willing to work for 2 dols. 50 cents a day and stayed with the work to the end. The Greeks proved unsatisfactory and were discharged after about a week, their places being filled by negroes, who were on the whole very satisfactory labour. One white man at 60 dollars per month was hired to run rod, hold tape, assist on carpenter work, &c., and with the writer and the negroes, varying from six to twelve in number, constituted the entire working force.

As soon as a sufficient area had been stripped work was started on laying out the Atlantic Coast line. The first method used was by setting up a plane table at one of the corners of the relief map, setting the edge of the alidade rule through the corresponding corner of the paper map and the point to be staked out, then scaling the distance and setting the corresponding point on the ground. This method proved to be too slow, and was discarded in favour of one developed by the writer, which was as follows:—The paper map was ruled off in rectangles corresponding to 20 by 30 feet on the ground, then a piece of tracing cloth the size of one of these rectangles was ruled off in squares corresponding to 1 foot square on the ground. The tracing cloth was laid on one of the rectangles on the paper map, the corners of the corresponding rectangle on the ground were staked out, and poles, marked off in feet, were laid 1 foot apart, parallel to one side of the rectangle. Then noting where the coast line crossed the lines of the tracing, a line was drawn on the ground through the corresponding points of the poles. When the coast line had been thus marked out the clay was carefully cut away with a mattock and the bottom of the ocean levelled off 6 inches below sea level, thus allowing 3 inches for concrete and 3 inches for water.

As soon as two or three hundred square feet of subgrade was ready the concrete was laid, the base being 2½ inches thick, one part cement, three parts sand and six parts gravel or broken stone, mixed fairly wet. The top was ½-inch thick, mixed one part cement and two parts sand, and was trowelled to a smooth finish when it was to be covered with water. After the bottom of the Atlantic had all been laid work was started on the land, the hilltops and rivers being located by the same method as the coast line. Stakes were set to the proper grade for the hill tops, the river

valleys were chopped out of the clay, being tested frequently for grade with the transit as the work proceeded, then the country between the hill tops and the rivers was modelled in to correspond with the contours on the paper map, and concreting begun.

The vertical scale was set at  $1=333$ , a vertical exaggeration of six, after several scales had been tried and this had seemed to be the most effective and natural. In finishing the land surface, practically all of which on the Isthmus is covered with a very dense forest of low growth, the attempt was made to get a finish which would have the same appearance as the real country were the latter viewed from a balloon at a sufficient height to make it appear the same size as the map. This effect was obtained by beating the surface of the concrete after it had been floated and partly set, first with a board set with wooden knobs and then with a block of wood and an irregular surface covered with battered tin.

When the map was about half completed work was started on the concrete wall surrounding it. This wall showed  $5\frac{1}{2}$  feet above the sea-level of the map on the inside and  $2\frac{1}{2}$  feet above the surface of the walk on the outside; it was 12 inches thick and panelled on the outside. The panels were 16 inches high, about 5 inches long and 2 inches deep, the moulding above the panels being 6 inches wide. By making the panels this length it was possible to divide the wall into twelve sections exactly alike, and one set of forms was used for the entire work. The inside forms were in two pieces, one 12 feet and the other 18 feet long, the full height of the wall, and were built of inch boards nailed to 2+4 inch verticals spaced about 2 feet on centres. The outside forms were built in panels, one form for each panel, and were 2 feet 9 inches high, the concrete being brought to the level of the bottom of the forms with slip boards. The forms were held in place by stakes at the bottom of the inside forms, through ties of telegraph wire at the bottom of the outside forms, and board ties about 6 inches above the top of the forms. The wall concrete was one part cement, three parts sand, six parts gravel, mixed wet. The forms were pulled the morning after a section of wall was finished, and the exposed surface plastered with a thin coat of one to two

cement mortar brought to a floated finish. The top of the wall was given a granolithic finish.

When about half of the map and surrounding wall had been completed a start was made on the painting. The land surfaces were sized and painted one coat of flat green, shaded off dark and light to give the proper hill and valley effects, the rivers being lined out in light blue. The bottoms of the oceans and lakes were stained blue, with light blue shading close to the shore. The paint stood all right, except when put on cement not thoroughly dry, when the first rainstorm turned it light yellow.

Three concrete boxes were built outside the wall, 2 feet 6 inches square in plan, with the top flush with the top of the walk around the map. A 1-inch iron pipe was connected with the water main and run into one of these which was located at the head of the Chagres river. This furnished the water-supply to keep the lakes and oceans at the proper level, the water flowing down the Chagres, filling Lake Gatun, and then overflowing into the Atlantic and through the canal into Sosa Lake and the Pacific. A 1-inch pipe under the locks permitted the draining of Lake Gatun, which, together with that of the other bodies of water, had to be done every fortnight. The outlet boxes for the Atlantic and Pacific were supplied with 6-inch earthenware drains connected with the sewer. The outlet was in the bottom of the concrete box and was stopped with a wooden plug sawed off at the desired water-level and having a central hole, which took care of the overflow during rains. When it was necessary to drain the oceans the plugs were pulled, and when replaced were made tight by shaking sand around them. The cost of construction was about 4,000 dollars.

GRAFTON Bridge, near Auckland, New Zealand, which is to be built of ferro-concrete, will have what is claimed to be the greatest single span for a bridge of this kind in the world. It will cost 40,000*l.* and will take 1,400 tons of cement. The span of the main arch will be 320 feet. The total length of the bridge will be 910 feet, and the height from the top of the roadway to the deepest part of the gully 147 feet. There will be room for three lines of traffic and two side walks for pedestrians.

## ENGLISH AND GERMAN POTTERY.

THE annual prize distribution connected with the pottery classes carried on in North Staffordshire under the Staffordshire education committee took place on the evening of November 22 at the Hanley municipal secondary school. Mr. F. H. Wedgwood presided. Mr. H. H. Cunynghame, C.B., legal under-secretary at the Home Office, delivered an address, says the *Staffordshire Advertiser*, referring at the outset to Josiah Wedgwood, who combined in a remarkable degree just the qualities the speaker desired to inculcate—enterprise and caution, together with an artistic feeling, which he sedulously cultivated. He wished to speak of the artistic side of pottery-making as well as the technical side. No doubt the students desired to become skilful potters. The one thing essential to success in a profession was to stick steadily to the work with an absolute determination to get to the bottom of it. That invariably and infallibly commanded success. It was a difficult thing to judge pottery. He would like them to be able to say, on picking up a piece of pottery, "Ah, yes, Wedgwood, 1797." "How do you know?" they might be asked. "Oh, I know the glaze," they should be able to say. They could only do this by an immense amount of study. They must learn their art and not be too proud to learn it anyhow or anywhere. There were a lot of interesting things to be found in cottages, such as old English lustre. They must also keep a notebook and note down everything they could. A perfect knowledge of the different qualities of English and Continental pottery as exhibited in museums, and as made at the different potteries, was exceedingly valuable, but exceedingly difficult to obtain. Speaking of art, he advocated the application to the subject of common sense and suggested as a definition "Art is a language." The artist ought to have something that he wanted to convey to people; then he ought to speak in a language which they understood, and he ought to make it beautiful, charming and agreeable. In household pottery the thing they had to see to was that the jug, the set of tea-cups, or whatever it might be, had an appropriate decoration. In good china, for instance, where there was a considerable quantity left white, that looked nice. In the selection of ornament, let them always

speak in the language people understood. Foreign art should be introduced very carefully. And let them make it as beautiful as they could. He deprecated the desire, as in France, for realism, and equally that for impressionist art. They must not be desperate if they could not all be wonderful artists. Something new in art only came to an artist once or twice a year. Many people would be content if they got a new idea once in a lifetime. Very good things could be done in a very ordinary way, and they must not expect too much of themselves or of other people. If they did all they could their powers would develop in spite of themselves. Speaking of styles, he recommended students to master the arts of the different countries for which there were facilities in the museums. As to the styles, Greek was the most important. The characteristics of the Greek school were severe balance and proportion always. The next in importance would probably be the Persian style, for the Persians were most wonderful masters of colour. The Italian majolica style would be important, as it showed how they could produce a wonderful and tremendous variety of colours, yet all harmonious. The next school in which he would advise anyone to study was the Chinese. He thought there was nothing better than the Chinese in the arrangement of the colours. These four classes—the Greek, Persian, majolica and China—seemed to him to be the most interesting phases for the pottery student to study. If the student wanted to decorate a jug with a spray of ivy let him go into the wood and get a piece of ivy, write a description of it and its manner of growth, make sketches of it in charcoal, pencil, ink and colours, with the object of acquiring a complete knowledge of the plant. Then let the student put the ivy away, and draw the plant "clean out of his head." He might at first find that he could not recollect how the veins were; and in that case he must go back and study the veins until he could draw the thing perfectly and entirely from memory. He would be making it true, and at the same time he would not be so lavishly copying nature, which would make the thing a mere transcript instead of a true design. A true design ought not to be this or that particular piece of ivy, but an ideal ivy. Dealing with the technical side, the speaker advised students to begin on chemistry, lay the foundation of a solid knowledge of the

elements of pottery, the mystery of silica, copper, cobalt, magnesia and the various oxides, and above all things do quantitative analysis well. Let that school lay a thoroughly good ground in chemistry and they would certainly improve the whole of the pottery art and trade. The speaker referred to the jealousy with which some old potters guarded their secrets, and said they still had their secrets, though many of the old secrets were secrets no longer through the advance of science. They were welcome to their secrets while they lived, but they should leave them for others when they died, and not let anything die that would be of value. They should be neither too jealous of their secrets nor squander them all over the world. He had been lately in Germany, and he found that the German workman was more methodical and plodding than the Englishman. In Westphalia the potter was a much cleaner man than the majority of workmen in pottery places. But he had no hesitation in saying that the English were the more able race of the two, and we need not be too afraid of German competition. The Germans had had singular facilities up to the present; they were a hard-working race, and it was natural that they should rise commercially. But the Germans themselves now admitted that the shoe was beginning to pinch them. They said that coal was getting dearer, everything was getting dearer, and his conviction was that in a few years we would not see nearly so much danger in German rivalry. The English race was a mixture. We were not purely Teutonic. There was more Celtic blood in us than in the Germans, and the consequence was that we had got greater gifts of imagination and invention. The English race were the cleverer of the two. In this district they had coalfields remarkably near them—but they were engaged in wasting a great amount of heat in the most terrible way he ever saw—and with their own brains, and with the great pottery traditions of the district, he was quite sure that if they would only set to work and prevent waste, there was no need to fear the future of the pottery industry of Great Britain.

Mr. W. Burton proposed a vote of thanks to Mr. Cunynghame. He hoped that from these pottery classes they were going to get the future managers and foremen of the potteries of the district. He did not look upon them as classes for training workmen at all. They were to train

the future masters of the trade—the men who would have the future guidance and control of the industry. He had been spending five or six weeks in Germany, and he had seen the museums, schools of art and shops. The German potters were wonderful workmen—and wonderful copiers of other people's ideas. Their great object was to take what the English potters could do, what the Copenhagen people could do, what the Swedes could do, and "do something that looks like it when you can't see it and sell it at half the price." But that was a fact to be reckoned with. As Mr. Cunynghame had rightly said, the Germans as a whole were more industrious, they knew their business better, stuck to it better than we did. If Englishmen in every great industry were to retain the supremacy they acquired by being first in the field—the first who ever organised industry on modern lines at all—it could only be because, along with the better brains of the breed, they had the same determination, energy and enterprise that their rivals in other countries were showing.

### THE OVERHEAD TRAMWAY SYSTEM.

At the invitation of the Birmingham and Midland Institute Scientific Society, Mr. Alfred Baker, the general manager of the Corporation tramways, attended at a meeting and delivered an address descriptive of the mechanical and electrical contrivances in connection with the city tramways system. Mr. Baker said the majority of the citizens of Birmingham had, he thought, now come to look upon the overhead system of tramways from a utilitarian point of view, and they would agree that, as a rule, after the first few days, they forgot all about the "abominations." The much abused overhead system was still the cheapest and most efficient system of locomotion yet devised. Many of them knew that the London County Council had been engaged during the past five years in putting down the conduit system in the streets of London. A few weeks ago their tramway accounts were published, and they showed that the traffic receipts were enormous. In round figures they amounted to 1,414,000*l.* The expense of earning that sum was only 1,075,000*l.*, leaving a balance of 340,000*l.* But here came the rub. Out of that balance of

340,000*l.*, interest and sinking fund on the capital expenditure absorbed no less a sum than 330,000*l.*, leaving a net balance of something less than 10,000*l.* on a turnover of a million and a half sterling. Why, in Birmingham, where of course the traffic could not compare at all with London, it was expected that the profits would far exceed that amount on about one-sixth of the London capital expenditure. Therefore he said the overhead system was by far the best in every respect, except perhaps at all with the aesthetic point of view. Of the three methods of overhead construction, the span wire system adopted by Birmingham was, in his opinion, far superior to the other methods. It was certainly neater, and it gave steadier running. Mr. Baker described the permanent way, the rolling-stock, the motors, the brakes and electrical equipment. He said new brakes were under test, and one had been recently inspected which promised to be "fool-proof." If the brake continued to be satisfactory after an extended trial he would certainly recommend the tramways committee to use it on the steep gradients of the city, for they recognised that nothing must be left undone and no expense spared in order to secure the safety of the travelling public.

### BOLTON BUILDERS' EXCHANGE.

An important local innovation, and one that will be watched with considerable interest, has been introduced in furtherance of the building and kindred trades, the scheme taking the form of an organisation to be known as the Bolton Building Trades Exchange and Club. The Bow Street assembly rooms, says the *Bolton Chronicle*, have been rented, and these are to be adapted as a centre for the meeting of those engaged in building and the many kindred trades. The idea is not a new one; it has materialised with a large measure of success in such important centres as Bradford, Halifax and Huddersfield, but this is its first introduction into Lancashire. Mr. W. Grime is the chief spirit in the movement locally, and he is associated in the project with a number of prominent members of the Bolton building trade.

The assembly rooms are admirably adapted for the purpose. Up to recently they have been utilised as a dancing

academy, but stern business and serious enterprise are to take the place of toe tripping and frivolous fancies. To quote from a circular sent out, the objects of the Exchange are to provide a meeting-place for fraternal and business intercourse between its members; to become a centre for the buying and selling of all kinds of commodities used in different trades and the arrangement of contracts and sub-contracts; and for the recreation of its members. The social and recreational part of the movement, be it noted, is given the last place in the objects; the place will be an "exchange," a business centre, before anything else, and it is hoped to widen and extend the facilities now afforded builders for meeting on matters affecting more closely their common welfare. But the social side will not be overlooked, and two billiard tables are being installed, and there will be every facility for friendly intercourse. The rooms are spacious, and, newly decorated, should provide an acceptable retreat for business men when the ordinary day's work is done. The prospects for the scheme are very encouraging; indeed 400 men have already signified their intention of becoming members, and when the place gets in thorough working order the membership will probably be very largely increased, for there are many hundreds in the various branches of the trade—bricklayers, joiners, plasterers, slaters, merchants, concreters, plumbers, &c. Of course the institution is confined to the masters, and the Exchange is not intended for any one class of members, but for the whole trade and allied sections. At present the club is privately owned, but eventually it will probably be run by a committee of members. The secretary offers to arrange all kinds of financial matters (temporary or permanent) on behalf of members at a minimum charge, and any legal work required by members at special rates. With a nominal subscription and the maximum of facilities, the institution should have an extended period of great usefulness before it.

At the sale of articles from the "Old Japan" exhibition at Earl's Court a model of a pagoda, consisting of 20,000 pieces of wood, was sold for four guineas and a fine Shibyama screen for five guineas.

**SANITARY APPLIANCES.**

By Mr. W. JENNINGS.

*(Concluded from last week.)*

It has become the practice on the part of many architects and others when selecting sanitary fittings for buildings to dispense with urinals, and direct that pedestal closets with hinged seats shall be made to serve the requirements of both closets and urinals. This procedure in the case of private closets or where the use is restricted to a few persons may be advantageously followed; but in public offices and similar situations where large numbers of persons congregate, no benefit is gained by the omission of urinals, as if the closets have to answer the double duty of water-closet and urinal more closets must obviously be provided than would be the case where the closets serve only the one purpose. Furthermore, a closet basin is usually 18 inches or less in height, convenient for sitting upon, whilst the customary height of a urinal basin from floor to lip is about 2 feet. Careless or indifferent persons will not take the trouble to lift the hinged seats, which consequently become sprinkled and wetted to the inconvenience of the next user. In point of relative cost there is little or no difference between the price of a complete closet apparatus and that of a urinal; but it must be remembered that whilst a urinal occupies approximately 2 feet of wall space, and about the same or less projection, a closet requires a separate apartment about 2 feet 6 inches wide and 4 feet 6 inches to 5 feet in depth, with walls or partitions, doors, &c., enhancing the cost as well as occupying a large amount of space. For positions where the closet apparatus is required to answer the dual purpose of w.c. and urinal, a special pattern of closet has been invented by Messrs. George Jennings, Ltd., in which the basin is formed with an inclined or sloping raised back with a self-rising counterbalanced seat. It most satisfactorily fulfils the two purposes, and is consequently largely adopted in positions where separate w.c.'s and urinals are not deemed necessary.

Syphonic discharge closets, which may be considered a comparatively recent introduction, may be divided into two classes, one type being actuated by the withdrawal of the air between the two traps by aspiration or a sucking upwards due to the down rush of water in the flushing-

pipe and the consequent discharge of this foul contaminated air into the closet apartment. This type of closet consequently is condemned by sanitarians as dangerous to health; and furthermore the aspiration of the air in the outgo of the closet seriously retards the escape of the contents. The second type is a closet known as the "Closet of the Century," in which the syphonic action is generated by the introduction of a jet of water into the outlet leg of the closet, driving the air between the two traps, through an escape pipe into the external air, thereby creating a vacuum in the outlet, and securing the discharge of the basin by atmospheric pressure. This apparatus has successfully withstood public criticism for upwards of ten years, has gained the highest awards of the Sanitary Institute and gold and silver medals, and is extensively adopted. The main features and advantages of this type of apparatus are the security of two water seals—one contained in the lower trap of a depth of  $1\frac{1}{2}$  inches, the other in the basin itself, and 3 inches in depth, provision being made for a constant circulation of fresh air being maintained between the two traps, and thereby the fresh air disconnection of the water-closet apparatus from the soil pipe or drain, which is advocated and sought for in arranging the discharges from baths, lavatories, sinks, urinals and other sanitary appliances, but which had never hitherto been satisfactorily accomplished in connection with water-closet apparatus.

The large bulk of water retained in the basin (some 6 inches in depth with a surface area of 12 inches by 9 inches and a water seal or trappage of 3 inches) is equal in quantity to that retained in a "valve" closet, but is secured without mechanism. A further unique and valuable feature peculiar alone to this form of closet is the entire forcible discharge of the contents of the basin by employing atmospheric pressure equivalent to about 15 lbs. per square inch, the consequent concentrated flush being sufficient to charge the drain with a solid bore of water during the time the closet is in action, thereby insuring the complete removal of the faecal deposit, and securing the drains in an efficient manner not possible with closets of any other system. An important and much appreciated improvement in the mode of flushing these closets consists of a simple form of pull-up regulating supply valve to which the water surface can be connected from a large main storage cistern,

thereby dispensing with the noisy, unsightly and objectionable flushing cisterns which are the bugbear of nearly every householder; whilst the requirements and regulations of the various water companies and boards are met and complied with by a simple contrivance in the interior of the valve, limiting the quantity of water supplied at each lifting of the handle to the maximum quantity prescribed and allowed by the water authority.

Whilst sanitarians generally have for years been in unanimous agreement as to the vital importance and necessity of all waste pipes from lavatories, baths, sinks, urinals, overflows from cisterns and rain-water pipes being thoroughly disconnected from the main or underground system of drains by discharging the waste pipes at the ground level over a gully trap, and the by-laws of many sanitary authorities even stipulate and require that these waste pipes shall discharge on to an open horizontal channel at a distance of several feet from the gully, it appears a curious anomaly that no consideration has apparently been given to the advisability and need of disconnecting the water-closet apparatus from the soil pipe or drain. Yet it will be admitted by all sanitary engineers and authorities that if it be essential to sever the direct connection of waste pipes conveying what may comparatively be termed innocuous liquids and matters, it should be of paramount importance to disconnect the water-closet from the soil pipe and drain through which are discharged the foulest and most deleterious liquids and matters—the exhalations and gases from which are known to be of the deadliest character—so as to render impossible under any circumstances the admission of air of any kind from soil pipes into the dwelling or building with which they are connected. Notwithstanding the importance of this subject, the only attempt towards adopting some precautionary measure was made some thirty years since by a few engineers to fix a syphon or hydraulically sealed trap at the foot of the soil pipe. This imaginary safeguard was at once found to be delusive and objectionable, as, while under certain conditions it formed no reliable barrier to the passage of air from the sewer or drain, it effectively retarded the flow and free escape of the sewage into the sewer, and destroyed the valuable scouring power of the liquids due to the momentum generated by falling

from the upper floors of the building. Furthermore, as was clearly demonstrated by the late Mr. George Jennings, the eminent sanitary engineer, in his valuable and able letter to the *Times* under date September 14, 1865, the hydraulic seal of all traps in direct connection with main sewers is so very susceptible to, and so easily affected by, increased pressure of air on the sewer side of the trap, as to be practically fallacious and dangerous to depend upon as a security for the purpose for which they are employed. This insecurity may arise from several causes, which are clearly explained in the late Mr. George Jennings's letter.

At the annual meeting of the Municipal and County Engineers held this last summer in Liverpool, a paper was read on these defects, and the solution of the soil pipe, drain and sewer ventilation problems of the nineteenth century, which excited considerable interest amongst those present. Time will not permit of my referring at length to the subject-matter of the paper, or to the discussion which took place upon it, but by many engineers it is considered that a hydraulically sealed disconnecting trap on main drains is worse than useless and should be dispensed with. One of its defects is indisputable, viz. that it offers no resistance whatever to the pressure of air due to back flooding of tidal or storm waters in the sewers with which it is connected; and, although it is not a new experience, I may quote as valuable and interesting testimony on this subject an extract from a letter dated July 16 this year, written to the *Surveyor* by Mr. P. Dodd, C.E., borough engineer of Wandsworth, in which the writer states that he knows of instances of sealed manhole covers (weighing about  $1\frac{1}{2}$  cwt. each) on the main sewers in the district of Wandsworth having been seen to rise and fall rapidly for several minutes as a result of the compression of sewer air in the manholes, caused by a sudden effluxion of storm waters into the sewers. If the pressure is sufficient to lift a weight of  $1\frac{1}{2}$  cwt., it necessarily follows that it is sufficient to force intercepting traps which contain at most from 20 lbs. to 30 lbs. in weight of water, and it consequently follows that the shallower seals of water-closet traps, gullies and the like are still more easily forced by such back pressure.

And when it be remembered that the air in the branch drain on the sewer side of the disconnecting trap is everlastingly foul and everlastingly imprisoned—except when it

is driven into the house drains by the back tidal pressure, as may occur occasionally during twelve months—it can be imagined how deleterious to health this concentrated essence of sewer gas must be. The manufacture of coal gas for illuminating purposes by distillation can only be effected in a closed retort; and sewer gas is produced by imprisoning air in sewers and drains, in which sewage not only passes, but is frequently retained until decomposition and fermentation takes place. Ventilation on a large scale, such as the entire abolition of intercepting traps, and the continuation of all soil and other waste pipes above roof level, would, by establishing a constant circulation of fresh air within the sewers, and the consequent neutralisation and removal of poisonous vapours, check, if not entirely prevent, the generation of sewer gas. But one great difficulty exists in adopting such a system of universal ventilation. Owing to the great variation in the heights of buildings in cities, as for instance, a two-storey building adjoining one of four or more storeys, the termination of the ventilating pipe at the roof level of the lower building would possibly discharge in close proximity to the windows of the higher building. Nevertheless, much could be done to improve the state of the air in the public sewers by carrying ventilating pipes from the sewers above the roofs of the many high buildings which are to be found in nearly all large towns.

The great importance of securing the fresh air disconnection of water-closets from soil pipes and drains being universally conceded, it is now only necessary to explain the unique method by which this most important problem has been solved by Messrs. George Jennings. In the patent "Century" closet with syphonic discharge, an entire innovation in the practice of sanitary engineering has been introduced, inasmuch as in connection with this apparatus there are two traps or hydraulic seals, one being 3 inches in depth and formed in the closet basin; the other 1½ inch in depth, formed of lead or other suitable material placed at the end of the syphonic outlet leg of the closet. It might at first sight appear in absolute defiance to all preconceived ideas and rules of sanitary engineering to place two hydraulically sealed traps in such close and intimate juxtaposition on the same line of drain or soil pipe, as the result has always hitherto been to confine or bottle

up fixed or stagnant air between the two water seals. This in course of time became converted into dangerous gas (commonly termed sewer gas) due to the passage of faecal and other impure matters; but, as will be noted, two air-pipes are provided between the traps of this closet, the upper ends of the two pipes being continued through the external wall of the building, and terminating in the open air. Whilst the closet is not in action there is thus a free and uninterrupted circulation of fresh air between the traps at all times. In the event of the seal of the lower trap becoming inoperative through evaporation, syphonage or excessive air pressure on the sewer side, due to compression caused by gales or tidal influences, the vitiated drain air would naturally escape through either or both of the air pipes, as the 3-inch seal in the closet basin would in this case form a reliable and effective barrier to any passage into the water-closet apartment or house. Furthermore, the air, whether stagnant, tainted or otherwise, must be driven outside the building, and when the working of the closet has ceased, the requisite quantity of pure fresh air to recharge the temporary vacuum is supplied and drawn through the upper ventilating pipe. This same procedure occurs whilst slops or waste waters are being discharged down the closet. The orifice of the outlet of the closet is 3 inches in diameter, equal to 7 square inches, consequently the atmospheric pressure effecting the discharge of the basin is equivalent to 100 lbs. ejecting force, insuring the complete and forcible conveyance of the contents of the basin throughout the entire system of drains and disconnecting chamber into the sewer, a result never before attained with any other form of closet.

At the monthly meeting of the Heywood and Middleton Joint Water Board it was reported that the expenditure on the new reservoir on Ashworth Moss to October 31, excluding 33,791*l.* for land purchased and interest during construction, amounted to 212,227*l.*, exclusive of plant amounting to 6,580*l.* The chairman stated that the new reservoir contained water to within a yard of the top water level, and so far the work had proved eminently satisfactory, no signs of leakage appearing in any direction.

**NOTICE TO ADVERTISERS.**

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

**EDITORIAL NOTICES.**

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

**TENDERS, ETC.**

\* \* As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

**COMPETITIONS OPEN.**

DURHAM.—Dec. 21.—For the County Council of Durham. Names of architects willing to submit competitive plans for training college for teachers. A selection of ten names will be made. An assessor will be appointed to adjudicate and select three designs. Premiums 250l., 100l. and 50l. respectively. J. A. L. Robson, secretary for higher education, Shire Hall, Durham.

RADCLIFFE.—Feb. 3.—The Radcliffe Urban District Council invite architects practising in Lancashire to submit designs and estimates for Council offices. Premiums of 75l., 50l. and 25l. offered for designs placed second, third and fourth. Mr. G. H. Willoughby will act as assessor. Mr. S. Mills, clerk, Council Offices, Radcliffe, Manchester.

WALES.—Dec. 19.—The Llandrindod Wells Urban District Council invite competitive schemes for (a) laying-out recreation ground; and (b) erecting a pavilion and other buildings. Full particulars are obtainable from Mr. D. C. Davies, clerk, Llandrindod Wells.

**CONTRACTS OPEN.**

ANDOVER.—Dec. 19.—Separate tenders, endorsed "No. 1" and "No. 2" respectively, for execution of the following works:—(1) Rebuilding Charlton Bridge parapets; (2) repairing the Andover Town Bridge. Mr. R. Walter Knapp, borough surveyor, Town Hall, Andover.

BAKEWELL.—Dec. 21.—For erection and completion of new closets, coal places and urinal at the union workhouse. Workhouse Master's Office, Bakewell.

BARROW-IN-FURNESS.—For erection of a flight of stone steps and work in connection therewith, at the secondary school, Duke Street. The Borough Engineer's Office.

BARROW-IN-FURNESS.—For construction of laboratory benches and plumbers' work in connection therewith, breaking out window and door, &c., at the secondary school, Duke Street. The Borough Engineer's Office.

**WREXHAM.**—Dec. 18.—For construction of a girder bridge near Puleston Mills. Mr. T. Rees Evans, district surveyor, Johnstown.

Mr. H. G. Wells has just completed a long and important novel describing a fierce inter-continental campaign, in which dirigible war balloons play an important part. This story, "The War in the Air," is to be a leading feature in the *Pall Mall Magazine* during 1908, and the first instalment appears in the January part, published December 18.

**GREAT CENTRAL RAILWAY.**—The complete provision made by the great railway companies nowadays for the rapid conveyance of Christmas parcels and hampers is in striking contrast to the old-time methods, and the Great Central Railway Company are to the front in catering for the needs of the public at Christmas time, having made complete arrangements for the collection, quick transit and prompt delivery of Christmas packages in all the chief towns on their system. Frequent collections of parcels will be made at the receiving offices in London and the large centres, and the traffic will be despatched by the first available train after receipt. Special trains will be run, and through vans attached to the principal express and mail trains to accommodate the traffic. Reduced through rates are now in operation, and the minimum weights formerly charged on packages of perishables at owner's risk have been abolished and the charges are now computed at actual weight. The rates for parcels carried short distances are lower than those by parcels post, and in the case of longer distances the rates for parcels beyond 1 lb. by parcel post are not exceeded. A duplicate label should be enclosed in each package, so that the name of the consignee may be ascertained in the event of the outside address becoming detached or defaced. A van will be sent to collect anything you wish to despatch on ringing up Parcels Superintendent, Marylebone Station—No. 584 Paddington.

## TRADE NOTES.

IN view of the serious fire which has recently occurred at Messrs. Gamage's premises in Holborn, it behoves everybody to consider taking precautions to prevent the spread of fire by using a good fireproof material, such as Uralite, which has come under our notice in many instances. Where woodwork is exposed to fire, a great danger is averted by covering the same with Uralite. It is easily fixed, being cut with a saw in the same manner as wood, and lends itself to rapid erection.

UNDER the direction of Mr. E. T. Johns, architect, Ipswich, the "Boyle" natural system of ventilation, embracing the latest patent "air-pump" ventilators, has been applied to the manual instruction centre, Ipswich.

THE British Flooring Company, of 152 Gray's Inn Road, London, W.C., have appointed Mr. Jos. Grey, of 33 High Bridge, Newcastle-on-Tyne, their representative for the North of England. The company have recently secured contracts in Grosvenor Square, Wimpole Street, Bruton Street, Old Bond Street, Edmonton, Luton, Oxford, Birmingham (several), Wishaw, and South Wales, for parquet, wood blocks, mosaic, marble tiles and cementolith floors.

MESSRS. J. B. JOYCE & Co. have just completed the erection of a large Cambridge quarter clock at Broughton-in-Furness Church, and also a striking clock with two dials at Kenfield Hall, near Canterbury. The same firm are making a large striking clock with three dials 6 feet in diameter for the new offices at Hawarden Bridge Steel Works, Shotton, Flints, and a similar one for Trafford Park, Manchester, for the new offices of Messrs. Norbury, Natzion & Co.

THE Stepney Borough Council have accepted the tender of Messrs. Babcock & Wilcox, at 8,523*l.*, for the boiler-house equipment at the Blyth's Wharf generating station, and the tender of Messrs. Willans & Robinson, at 28,140*l.*, for the complete equipment of the generation portion of the station plant.

THE Council schools, West Cowes, are being ventilated by means of Shorland's patent exhaust roof ventilators and hygienic inlet ventilating panels, the same being supplied by Messrs. E. H. Shorland & Brother, of Manchester.

MESSRS. LIBERTY & Co., LTD., are carrying out the contract for decorating and furnishing three floors, containing 150 rooms, of the new Piccadilly Hotel in the Early English, Georgian, French and what has become known as the Liberty styles.

MESSRS. FARNHAM, LTD., are now carrying out, by their sand blast process, the restoration to its original colour of the stonework of the older portion of the premises of Messrs. Thos. Cook & Sons, Ludgate Circus, under the supervision of Messrs. Smee & Houchin, Byron House, 82-5 Fleet Street. On completion of the work, the old portion of the premises—although built over thirty years ago—will harmonise with the new extension just being completed. The same firm have just completed the waterproofing by paraffin wax and the cleaning by sand blast of the frontage of the old portion of Messrs. Hall Higham's warehouse in Dale Street, Manchester, so that the old work shall tone with the new extension of the warehouse, which is now being completed. The work has been carried out under the supervision of Messrs. Charles Heathcote & Sons, architects, 64 Cross Street, Manchester.

MESSRS. HERRING, SON & DAW desire to announce that, in consequence of impending rebuilding, they have removed their City offices to No. 12 Old Jewry Chambers, E.C., and they desire that all future communications should be forwarded to them at that address.

WE have received the Christmas number of the *Quarry*, which contains a reproduction of "Iona" marble in natural colours, together with an interesting article on the subject, with block analyses of the chemical composition.

## VARIETIES.

THE Hornsey Borough Council has received the sanction of the Local Government Board to borrow 40,000*l.* for the erection of workmen's dwellings.

MR. FRANCIS RECKETTS, of Queen's Gate, London, has given 10,000*l.* to the Great Northern Hospital, Holloway Road, N., for the building of a convalescent home in connection with the hospital.

IN pursuance of the agreement under which the London and Lancashire Fire Insurance Company acquired control of the Standard Marine Insurance Company, Ltd., Mr. Wellington Archbold Williams has now been appointed managing director of the latter company, and Mr. James Primrose Rudolf, underwriter.

"LONDON by Night" forms the subject of one of the most noteworthy articles in the Christmas number of *Harper's Magazine*, which, in addition to much entertaining and instructive literature, contains an interesting account of the "Civilisation of Ancient Babylon," while the numerous illustrations throughout are of the usual high class.

THE Gorton Council has decided to make application to the Local Government Board for sanction to borrow 11,349*l.*, the expenditure in respect of the new tramways which have been laid in Gorton Lane, Wellington Street and Reddish Lane, which connect Stockport with Reddish, Gorton, Openshaw and Cheetham Hill.

MESSRS. CHUBB & SON, lock and safe manufacturers, have acquired land on the Wednesfield Road, Wolverhampton, for the purpose of erecting thereon large works.

Nearly ten years ago the firm erected new works in Railway Street, but these are too small for the great growth of business. Messrs. Chubb propose, it is believed, to transfer their London workmen to Wolverhampton.

THE Westminster City Council have decided to purchase the freehold interests of certain property in Wardour Street, necessary for the improvement of that thoroughfare. It was stated that the initial expenditure on the scheme would be 10,000*l.* In the last six years Westminster has spent no less than 500,000*l.* on improvements. The London County Council decline to contribute to the scheme.

FROM Columbia Mr. Consul Gillies writes that the city of Barranquilla has greatly improved during recent years. The streets, which were in very bad order, are now being attended to, and are being provided with good pavements. An impetus has been given to house construction by the cheapness of the sandstone bricks, which are made in very large quantities in the immediate vicinity of the city. Large lots of this brick have been exported to Cuba and also to Panama for construction purposes.

AT a meeting of Birmingham University a letter was read from Lord Calthorpe offering to give about 20 acres of land, formerly used as a Volunteer rifle range, as a recreation ground in connection with the university. The land, which adjoins the new university buildings at Bournbrook, is valued at 15,000*l.*, and follows a gift by his lordship and his brother in 1900 of the 27 acres which form the site of the new buildings, and which was estimated to be worth 20,000*l.* The offer was gratefully accepted.

THE minutes of the sewage committee of the Glasgow Corporation report that prolonged negotiations took place with Messrs. Kinnear, Moodie & Co. regarding the extraordinary work and expense incurred in the construction of sewer No. 1 of the southern district sewage works through old coal workings in Darnley Street. The contractors have now agreed to accept 60,000*l.* in full settlement of their contract. Mr. A. B. Macdonald, the city engineer, reports the whole of the excess of 14,618*l.* 11*s.* which will result in the cost of the contract is due to the extraordinarily heavy protective works rendered necessary to secure the sewer in the old coal workings.

**Head Office: 72 Victoria Street, S.W. Works: Southall.**

At the old town hall, Cardiff, last week, the property, which comprised the old town hall, the old post office, the old police station, police court, parade ground and other buildings, making altogether a self-contained site nearly an acre in extent, freehold, with splendid frontages to St. Mary Street, Westgate Street, and a new 40-foot street connecting the two streets mentioned, was put up for auction. Bidding commenced at 25,000*l.*, then there came offers of 27,000*l.* and 30,000*l.*, and this was increased by 1,000*l.* bids until 36,000*l.* was reached, when bidding stopped. On behalf of the Corporation, Mr. Douglas Young then bid 65,000*l.* for the property, which was bought in.

WHILE the total units sold by the Marylebone municipal electric undertaking in the quarter ended June 30 last were 1,600,776, against 1,487,114 in the corresponding six months, 1906, the average price realised per unit in the former quarter was 4.031*d.*—"a serious fall," the electrical accountant (Mr. E. J. Jennings) reports, "from the estimated yield average for the year of 4.95*d.*" He considers that the average price for the year, inclusive of meter rentals, will not exceed 4.4*d.* He attributes the lower yield (1) to the fact that the new business is of necessity larger for the cheaper classes of supply—motor and heating purposes, basement and sign-lighting; (2) to the fact of an increased number of "old" subscribers availing themselves of the new tariff with the result that in seventy investigated cases the fall in the average price exceeded 50 per cent.

CHRISTMAS ON THE CONTINENT.—Exceptional facilities are offered by the Great Eastern Railway Company's British Royal Mail Hook of Holland route for visiting Holland and Germany during the Christmas holidays. Passengers leaving London in the evening, and the Northern and Midland counties in the afternoon, arrive at the principal towns in Holland the following morning, Cologne at noon, Berlin, Dresden and Bale in the evening. A corridor train, with vestibuled carriages, dining and breakfast cars heated by steam, is being run on the Hook of Holland service between London and Harwich. Through carriages and restaurant cars are run to Berlin, Cologne and Bale. Tickets at reduced fares will be issued to Brussels *via* Harwich and Antwerp December 21, 23, 24 and 26, available for eight days. Tickets dated to suit the convenience

of passengers can be obtained at the continental inquiry or booking offices, Liverpool Street station.

At a meeting of Inverkeithing Town Council last week a report was submitted by a committee appointed to inquire into a complaint by a ratepayer that Mr. J. Lambert, who is Dean of Guild, had been entrusted with Town Council contracts. The report stated that it was not the case that the Dean had been employed by the Council, but his son, Mr. Wm. Lambert, had on several occasions tendered for work and his offers had been accepted. The Council accepted the offers in the belief that Mr. William Lambert was acting as an independent contractor, and the committee were not in a position to say that that belief was not justified. While they recommended that no action be taken with regard to the complaint, they suggested that it might be a matter for after consideration whether the Council should employ Mr. Wm. Lambert for slater or plasterwork while his father remained a member of the Council. By the casting vote of the chairman the report was accepted.

In a worthy spirit of enterprise the Great Central Company are catering handsomely for the Yuletide traffic. Most extensive arrangements have been made for the running of express trains, with buffet-car accommodation, at excursion fares from Marylebone on Sunday, December 22, Tuesday, December 24; Wednesday (Christmas day) and Thursday (Bank Holiday). The cheap bookings apply to over 300 of the principal towns and holiday resorts in the Midlands, Yorkshire, Lancashire, Lincolnshire and the general districts of the North. The facilities on the Sunday and Tuesday are offered in order that the convenience of different sections of the travelling public may be suited. The compartments of the trains represent the acme of comfort. They are luxuriously upholstered, well lighted, perfectly ventilated and maintained at a genial temperature, without being stuffy. It is good to see a railway company so closely studying the needs of its patrons. Shopkeepers and others whose business will keep them in town until late on Christmas Eve will have the advantage of suitable trains to take them for the "home holiday" of the year. On applying at Marylebone station or any of the company's town offices, or sending a postcard to Publicity Department, 216 Maryle-

IN a contribution to the Royal Society of New South Wales, Mr. H. D. Walsh, M.Inst.C.E., the engineer to the Sydney Harbour Board, deals with the serious trouble caused by the ravages of various marine worms in timber piles used for the construction of harbour works. As the same organisms now infest all tidal waters in Great Britain, the subject is one that appeals to harbour authorities, wharf-owners and others concerned in the provision of accommodation for shipping of various classes. In addition to the limnoria which honeycombs soft timber, and the sphæroma whose action is to erode the surface layers, we have the formidable teredo, a worm sometimes attaining the length of 6 feet and the diameter of more than half an inch, and capable of boring into the hardest woods. Mr. Walsh says the teredo easily and rapidly 'riddles' iron-bark piles, and that the only timber which it dislikes is the Australian turpentine. Various expedients have been tried for the protection of harbour works from these pests, a fairly successful but costly remedy having been a sheathing of Muntz metal. Unfortunately it has been proved by recent investigation that the metal is apt to corrode, leaving a brittle shell which is very easily damaged. A far better practice than any attempt to protect so perishable a material as timber is to abandon its use altogether in favour of ferro-concrete, a combination of steel and concrete which is immune from the attack of sea worms and unaffected by the slower but equally certain process of natural decay. These facts are abundantly proved by sea walls, quays, wharves and jetties in various British sea-ports.

At a meeting of the Rhyl Urban District Council, held on Monday, the 9th inst., the designs of Messrs. Maxwell & Tuke and F. Bennett Smith, F.R.I.B.A., of Manchester, were selected, after a competition limited to six architects, for the erection of a pavilion to accommodate 2,000 people, proposed to be erected by the Council on the foreshore at Rhyl, and which it is hoped will be ready for use early

next season. It is intended to construct the building of brickwork, faced with red and buff stock bricks with terracotta dressings, with verandahs and balconies on all sides. Owing to its unique position, the treatment of the exterior has been very carefully considered, so as to give a picturesque appearance when viewed from any point of the compass. There will be a turret at each end of the four angles with a large octagonal dome in the centre. The platform will be sufficiently spacious to accommodate the largest Welsh choir, and particular attention has been paid to the acoustic properties. Numerous entrances and exits have been provided, and as the Council intend to lay out the surrounding grounds as ornamental gardens and terraces, the combination should form a great attraction to Rhyl, and supply a long felt want. The successful architects have had a large and varied experience in the erection of entertainment buildings at sea-side and other resorts, since their firms were responsible for the construction of the Manchester Jubilee Exhibition in 1887.

#### SHEFFIELD CONTRACTORS.

THE following letter of protest has been sent by the Sheffield Master Builders' Association to the town clerk respecting the statements concerning construction of sewers:—

Cross Burgess Street, Sheffield:  
December 9, 1907.

Dear Sir,—We beg respectfully to call your attention to the report appearing in the daily papers of the Local Government inquiry held on Tuesday last, and to say that the evidence given by the city surveyor and the chairman of the highways committee reflects so seriously on the members of this Association that they considered it necessary to convene a special meeting yesterday for its consideration.

After considering the whole of the evidence given, the meeting unanimously passed a resolution protesting in the strongest possible terms against the persistent statements to the effect that nearly all the sewers laid by contractors were, when taken out, found to be defective.

By Appointment to their Majesties the King and Queen.

A Splendid Example of COLOUR-WORK in Permanent Ink Photo. by M. PAUL AUBERT BAUDOIN.

GILBERT WOOD & CO. Ltd., 6-11 IMPERIAL BUILDINGS, LUDGATE CIRCUS, LONDON, E.C.

While the Association do not wish to positively state that every sewerage job done by a contractor has been finished in the very best possible manner, yet they are forced to the conclusion that any defects which may have existed should have been effectually remedied by the Corporation's supervision of the job, and on the other hand they could point to several instances of work done by the Corporation which have not turned out satisfactorily. They consider that the instance given of an award against the Corporation of 16,000% or 17,000%, when the Corporation thought the contract was completed, proves most conclusively that the plans and specifications must have been defective, and they cannot admit the implied inference that the Corporation could have completed this particular job in the same manner for 16,000% or 17,000% less than the contractor. Moreover, the balance of evidence, and disclosures from time to time, do not warrant the assumption that in all cases work can be done more cheaply by Corporation Works Departments.

The Association maintain that the work can be done as cheaply and as efficiently by contractors, and they cannot see why what is done every day in other large cities should be impossible at Sheffield. The inference to be drawn from the evidence as reported is therefore tantamount to branding the members of this Association and Sheffield contractors as a whole as utterly incapable, with the only alternative that it otherwise imputes to them a standard of business morality to which they even more strongly object. If the only evidence of an adverse character which can be brought forward is in relation to work done some fifteen years ago, surely that can be no reasonable argument against the contractors of to-day.

In conclusion, the Association, on behalf of the building trade of Sheffield, wish to protest most emphatically against such an unwarrantable attack on their business capability and honesty, and think that at least some explanation is due to them.—Yours very faithfully

(On behalf of the Association),

THOS. SMITH, Secretary.

Mr. H. Sayer, Town Clerk, Town Hall, Sheffield.

P.S.—A copy of this letter is being sent to the two local papers and to the President of the Local Government Board.

## ELECTRICITY AND FIRE RISKS.

At the monthly meeting of the Insurance and Actuarial Society of Glasgow Mr. T. Crichton Fulton read a paper on "Electricity: Where the Risk comes in." He said that he proposed to treat the risks associated with electricity into two classes—preventable and unpreventable. Amongst the former were the fusing of gas pipes through arcing from steel or other metal tubes which had become "alive" or charged with electricity from a leaky conductor, and which were either in direct contact with the gaspipes or in contact through some earthed metalwork in the building. This constituted a grave risk, and was responsible for about 40 per cent. of the electrically caused fires in Glasgow. Amongst other risks treated of by the lecturer were those due to bad workmanship, faulty material, materials and apparatus wrongly or carelessly erected, apparatus and fittings erected in wrong places. Most, if not all, of these risks could be obviated or greatly minimised by careful supervision, inspection and testing by competent engineers at the time the work is done, and especially by inspection at intervals to detect in time dangers due to the deterioration of materials. Amongst the so-called unpreventable risks, the lecturer classed all those that arose after the contractor was away from the job and the proprietor or consumer left to the freedom of his own will. Included amongst those were interference by other tradesmen who might be called in, and the numerous cases in which people in a house or building jeopardised property by ignorant usage or treatment of electric light or power apparatus, casings, tubings, wiring, or fittings.

## THE INSTITUTE OF SANITARY ENGINEERS.

The annual dinner of this society was held on Wednesday evening last at the Holborn Restaurant, Mr. W. J. Dibdin in the chair. Among those present were:—Dr. J. C. Thresh, M.D., D.Sc., Mr. W. R. Riley, F.R.I.B.A., Dr. W. R. Smith, M.D., D.Sc., Mr. W. Marriott, Dr. W. H. G. Macleod, Mr. W. Whitaker, B.A., F.R.S. and Mr. W. H. Maxwell

The toast of "The King" was followed by that of "The Institute of Sanitary Engineers," proposed by Mr. W. Whitaker. In the course of a short speech Mr. Whitaker said the present was an age of specialisation, when it was no good to have merely gained the proficiency of an engineer—it was necessary to have something in front of the title. It was because of this that a great profession like the engineers would have departments which must be recognised by divisional marks and signs. He had been reading the presidential address to the Institution of Civil Engineers, and he found therein a note of congratulation because other societies were specialising in branches of engineers' work, and that those other societies had done the Institution no harm but much good. The Institute of Sanitary Engineers was doing well he felt sure, because it had been brought to his notice that the members were discontented, and they wanted something more than they possessed at present. Like some other societies, the Institute was in need of better quarters, and recently the members had agitated for new premises. Those were healthy signs, and he had come to the conclusion that their society was therefore in a flourishing condition. He hoped the members would never think their organisation was perfect, but always believe that there was still something further for them to do.

Mr. W. J. Dibdin, who replied to the toast, explained how he came to occupy the chair. Mr. Baldwin Latham, he said, was prevented from attending because of ill-health, and their President-elect was unavoidably absent owing to municipal duties. Mr. Dibdin believed discontent was not altogether bad for a society, and there was no doubt that the want of room in the present quarters of the Institute was a pressing need. He hoped it would not be long before they had a more congenial home. The number of members was increasing both in London and the provinces; and although there was some remedy in the establishment of branch centres, yet it was necessary to improve on the accommodation at headquarters.

Mr. T. B. Simmons (chairman of Council), who also replied, said he was glad Mr. Whitaker had mentioned the fact of the specialisation of the different societies. As was well known, the Institute was directly allied to the engineering profession, but they were, besides, an educational

body. With a view to making their educational work as interesting as possible a friend of the society had offered a gold and a bronze medal to the members. During the past year they had had an increase of sixty-three new members. The examinations held by the Institute showed an average of 60 per cent. in successful results. With regard to new offices he was pleased to be able to state that the Institute had acquired better premises in Victoria Street, and that the new President intended to deliver his opening address there on January 20 next.

Dr. Thresh proposed the toast of "Kindred Institutions," and said he could not make up his mind to which the Institute was most closely allied. He had no doubt, however, that one of the best societies an engineer could join was their Institute, for sanitary work meant the greatest good to the greatest number. He used at one time to think the increase of young societies was an evil, but he now believed they were justified in their formation. He felt, too, the younger bodies had galvanised many of the older societies into life, and that the latter were now becoming as energetic as some of the younger institutions. He suggested that it might be well if the sanitary bodies became affiliated in the same way as the medical societies had been brought together to form one Royal Society of Medicine, although each body remained distinct. If the sanitary societies could unite like that they would be more powerful than they were at present.

Mr. W. Whitaker in responding said there ought to be some federation between the sanitary societies with one common object. There might be some gain by federation, though care should be taken to avoid loss to any society. He thought there were too many men working independently, and so duplicating the results of others. As a young society the Institute should guard its independence, but they should be ready to hold out the hand of fellowship to others who were their colleagues. He believed the societies of the United Kingdom to be on the whole in a very healthy state, and that there was very little jealousy among them. There might be little differences now and then, but generally their efforts were wholly for the good of humanity. Mr. W. J. Dibdin proposed "The Visitors." Mr. W. E. Riley, F.R.I.B.A., and Mr. W. Marriott responded. The toast of "The Press" concluded the list.

## LOUISIANA RED CYPRESS.

For Joinery Work of all kinds, Sash, Doors, Blinds, etc., Exterior or Interior Finish, Porch Columns, it is the Ideal Wood. For Conservatory and Greenhouse Construction its great durability under almost intolerable alternate wet and dry conditions, combined with its lightness, strength, and straightness of grain, makes it the best wood for these purposes. ## AN ELECTRICAL EXHIBITION.

It is proposed to hold an electrical exhibition in Manchester next year. The following arrangements are suggested by the promoters:—An influential president to be elected; a vice-president or presidents to be elected; a list of patrons to be secured; a general committee to be appointed, consisting of five representatives of corporations or councils donating to the funds, two representatives of supply companies donating to the funds, two representatives elected by the Institution of Electrical Engineers, one by the Municipal Electrical Association, three representatives of the National Electrical Manufacturers' Association, two representatives of the Electrical Contractors' Association, and five representatives from among the general exhibitors. From this general committee an executive or acting committee will be appointed, with full powers to carry out the scheme on behalf of the main committee. Hon. consulting engineers, Mr. S. L. Pearce and Mr. V. A. H. M'Cowen; general manager, Mr. C. S. Northcote; organising secretary, Mr. W. Davenport. Profits arising out of the exhibition are to be allocated—(1) In a percentage return to exhibitors; (2) a percentage return to donors; (3) a percentage to be contributed to charities connected with the electrical industry; and (4) a surplus, if any, to be dealt with by the committee. The circular adds:—"It is of interest to put on record that after providing somewhat heavily for expenses to carry through the Olympia Exhibition, several items of which it will not be necessary to incur in connection with the forthcoming one, a very substantial surplus of 3,793*l.* was available to be dealt with for the benefit of the trade, and was distributed in the following manner:—2,168*l.* was returned to exhibitors as a percentage upon their space rentals, 110*l.* was awarded in prizes, 1,000*l.* was allocated to the benevolent funds of the Institution of Electrical Engineers and of the National Electrical Manufacturers' Association, and 515*l.* was invested by the trustees as funds for holding another electrical exhibition under similar auspices in London. It is fully anticipated that the results of the forthcoming exhibition will materially exceed the figures named, as the combination of all interests connected with the electrical industry will insure harmonious working."

## NEW CATALOGUE.

The new catalogue of sanitary appliances manufactured by B. Finch & Co., Ltd., must strike everyone who opens it by the excellence of the illustrations, which present an array that is more than sufficient for the sanitation of the largest public institution. It is commonly supposed that such work need be of only the plainest forms. But whenever there is a possibility Messrs. Finch in their mountings and in their marblework and pottery produce pleasing forms. The ordinary householder will also consider it an advantage to have the prices given not only of an appliance as complete, but also of the prices of the details, however small. The public may be glad to know that periodic inspections are undertaken by Messrs. Finch, and cisterns, baths, traps, &c., kept in order at a reasonable rate. They also prepare plans and specifications in connection with sanitary installations for architects. Having had experience for half a century and undertaken contracts for the Office of Works, the Admiralty, railway companies, clubs, hotels and hospitals, Messrs. Finch's advice is worth seeking. The appliances include varieties of closets, lavatories, baths, sinks, fittings, hot-water cylinders, syphons, and, in fact, whatever is expected to be provided by sanitary engineers for public or private use or for hospitals. As equal care has been taken with each of the different varieties of goods, it would not be fair to describe any one class as if it were their specialty. But the fact that some of the appliances have been especially designed for the use of surgeons in hospitals and infirmaries suggests the confidence placed in Messrs. Finch and the tests to which their inventions are subjected.

By instruction of the Birmingham watch committee, Mr. A. R. Tozer, chief officer of the fire brigade, has circulated a printed notice calling attention to the large number of fires in the city which result from carelessness, especially in the following matters:—(1) Throwing down lighted matches, (2) leaving candles, lamps or gas burning near curtains, &c., (3) carelessness in airing clothing. The notice says:—"175 fires occurred in Birmingham this year from these causes alone. The dangers to life and property from fire being so enormous all citizens are earnestly requested to take every possible care in these matters."

**MUNICIPAL ENGINEERING.**

ON Monday Mr. George Green, borough engineer of Wolverhampton, read a paper before the members of the Midland Association of Local Government Officers upon "Some Aspects of Municipal Engineering." Mr. Green said that, amongst other things, the municipal engineer must be an expert in hospital construction, for it was unfortunately the case that no town was complete without accommodation being provided for people who contracted smallpox or scarlet fever. It was not necessary that the engineer should be an architect capable of designing a beautiful building, but it was essential for him to understand how to provide a hospital containing all those modern improvements best calculated to enable patients to recover, and also to prevent the spread of the disease to other members of the community. Respecting the making and maintenance of roads, Mr. Green said that, largely owing to the motor-cars, a number of new methods of road-making had recently come to the front. Roads which a few years ago were considered to be of the best type were now amongst the worst in the country, owing to the suction of the rubber tyres tearing up the binding and even the metal itself in wet, and particularly in frosty weather. There was also the fact that the cars created an appalling amount of dust as they were driven from town to town. This new problem which had to be faced by engineers had by no means been solved, chiefly owing to the great expense. He thought the most satisfactory solution would be found in treating the roads with some preparation of tar, either by using it as a matrix with the stone when being laid, or by painting it or spraying it on the surface after the work of construction was completed. The former method was the most expensive in the first instance, but where it could be carried out it was the best method.

**DISPERSAL OF FOG.**

THE Director of the Meteorological Office consented to examine and report upon the proposals of Signor Demetrius Maggiora "to prevent the formation of fog or to disperse it in case it is already formed, and also to disperse and destroy all clouds, and to prevent rain, hailstorms, lightning and thunder."

Dr. Shaw, who has now made his report, states with regard to the object of the invention:—"It once more raises the whole question of the possibility of affecting the weather by artificial means, which, whenever it has been investigated by competent authorities, has been decided in the negative, except in the special case of the lightning conductor." Apparently the process of bombardment which is the essential point of the invention in question has been recommended with similar confidence as a means of making rain instead of preventing it, in Australia and the United States, in which countries stress of weather is felt in the form of drought.

The report proceeds, with regard to the claim of the inventor to prevent hailstorms:—

"The prevention of hailstorms has been the subject of vast expenditure and prolonged investigation in Austria and Italy since the recrudescence in 1896 of the Mediaeval practice of weather shooting in a form of which Signor Maggiora's apparatus affords the largest model. This new form introduced some new features from the point of view of experimental physics, and the movement swept the whole of Southern Europe with a wave of enthusiasm for weather shooting. After much inconclusive discussion an international conference of experts was invited by the Austrian Government to meet at Graz in 1902. The conclusion arrived at was that there was probably no effect attributable to the shooting, but the evidence was not sufficiently clear to justify the categorical statement that the ineffectiveness had been proved. Further trials under careful conditions were therefore made in Austria under Professor Prohaska, and in Italy under a Government commission of which Professor Blaserna, senator, Professor of Physics in the University of Rome, was chairman. For brevity I quote only the concluding paragraph of Professor Blaserna's statement:—The final result of the whole campaign against hailstorms, which has lasted five years, is entirely negative. It would have been much more gratifying if we had found ourselves able to adopt in future an effective method for combating one of the greatest enemies of Italian agriculture. Nevertheless, though the final result is negative, it affords the consolation of finding ourselves in a position to state that no good is to be expected from the methods tried, and that

we must protect ourselves from the effects of this scourge by entirely different methods."

The subject was also dealt with in an article in the "Meteorologische Zeitschrift," and Professor Pernter, director of the Austrian Meteorological Office, the writer of the article, who took an active part throughout the investigation referred to therein, states:—

"Henceforth the matter is disposed of. Not only among scientific men, but also among all objectively minded persons among agriculturists. The failures at Windisch-Feistritz and Castelfranco, and the ineffectiveness of rockets and bombs, as demonstrated by the Italian experiments, entitle us to say, 'Hereby the end of weather shooting is sealed.' In a footnote, Professor Pernter adds:—'No doubt the future will yet see many who seek salvation in weather shooting in spite of all and everything; but science is entitled to leave them to their imaginings. For us the matter is disposed of.'"

Dr. Shaw's report continues—

For all scientific meteorologists these conclusions are final. No further expenditure upon the artificial modification of weather in the form of hailstorms can be justified on scientific grounds.

The apparatus which Signor Maggiora now offers for removing London fog is apparently on similar lines to that supplied in Italy for dispersing hailstorms. From the scientific point of view, hail affords a much more specious opportunity for human interference than fog. The atmosphere is then in a state of great commotion preceded by abnormally unstable conditions. A London fog is incidental to conditions of unusual stability, and Signor Maggiora's memorandum suggests no physical process which could produce any effect in accordance with the known physical properties of the atmosphere.

It may be remarked that the weight of a cubic mile of air is about 5,000,000 tons, and consequently the weight of fog-laden air in the case of a fog a mile thick extending over the district of greater London alone is 3,000,000,000 tons. It is obviously useless to attempt the motion of so great a mass by mechanical action.

Dr. Shaw, in conclusion, states:—

I may sum up by saying that the claim to prevent or disperse fog is entirely unsupported by any evidence, the

claim to prevent rain is opposed by the more frequent claim of similar processes to produce rain in countries which suffer from drought, and the claim to affect hailstorms (which is associated with that regarding thunder and lightning) is not allowed by the scientific experts of Austria and Italy who have conducted special investigations on the subject for their respective Governments.

Having regard to the terms of this report, the public control committee do not feel justified in recommending the Council to expend money in connection with experiments with Signor Maggiora's apparatus, but at the same time they think that the inventor should be afforded facilities to undertake experiments at his own expense. They have been in communication with the main drainage committee in the matter, and are informed that there would be no difficulty in providing a site for the erection and experimental use of the apparatus on the northern outfall sewer embankment.

They have conveyed to Dr. Shaw our thanks for the valuable information which he has been good enough to furnish to the Council, and recommend:—

"That the main drainage committee be authorised to allow Signor D. Maggiora the use of a site, on land held for main drainage purposes, in order to enable him to conduct experiments with his apparatus for the prevention and dispersal of fog, and that the grant of any such facilities to Signor Maggiora shall be made on the distinct understanding that the experiments are not being carried out under the direction of the Council, and that the name of the Council shall not be used in any way in connection with any application for financial aid for working the invention."

The gas committee of Glasgow Corporation have come to an agreement with the Ironmongers and Plumbers' Associations regarding the supply and fitting-up of gas appliances (other than cooking stoves), the wages to be paid for such work, the terms on which the plumbers and ironmongers who are members of the associations are to be entitled to purchase goods from the Corporation stock, and the supply of gas for the purpose of exhibiting and giving in their premises demonstrations of gas appliances.

## LOUISIANA RED CYPRESS

For Joinery Work of all kinds, Sash, Doors, Blinds, etc., Exterior or Interior Finish, Porch Columns, it is the Ideal Wood. For Conservatory and Greenhouse Construction its great durability under almost intolerable alternate wet and dry conditions, combined with its lightness, strength, and straightness of grain, makes it the best wood for these purposes. Free Sample and other information mailed on request.

# MARPEDO WHITE JAPAN

## SLOW DRYING.

Suitable for either exterior or interior High-Class Decorative Work, invaluable to Architects, Decorators, Ship and Yacht Builders, Railway Companies, &c. It is easy to manipulate, and large areas can be covered evenly. When dry it presents a hard, brilliant and durable surface, which will not crack. On properly prepared surface one gallon of MARPEDO SLOW-DRYING WHITE JAPAN will cover about 80 square yards. It dries in about 12 hours.

THE British Consul-General at Antwerp reports that tenders are invited by the municipal authorities of that city for the construction of two groups of metal sheds on one of the new subsidiary docks at Antwerp. The estimated cost of the work is about 23,736l. Tenders, in sealed registered envelopes, should be delivered to le Bourgmestre, Hôtel de Ville, Antwerp, not later than the 30th inst. A deposit of 35,000 francs (about 1,400l.) will be required to qualify any tender.

## TRADE NOTES.

MESSRS. MURRAY, LOTZ & Co., of 102 Fenchurch Street, E.C., have been appointed by the Patrick Brass and Copper Works (A. Low), Glasgow, their sole agents for England and the Continent.

MESSRS. OETZMANN & Co., LTD., have issued a catalogue of "Presents for all Seasons" from their stock, showing furniture and decorative articles of an acceptable kind at reduced prices.

MESSRS. RIPOLIN write us that they are removing to more commodious premises on January 1, and their address will be 35 Minories and Nos. 1 and 3 Haydon Street, E.C., as and from that date.

## NEW CATALOGUE.

At the Christmas season thoughts of presents inevitably arise. Some wish to receive them, others happily are prepared to give them. It is a difficult task apparently to select the gifts. Any liberal-minded gentleman or lady who wishes to give a token of goodwill to a young student of architecture or engineering should lose no time in obtaining a copy of the latest catalogue of W. F. Stanley & Co. Every one of the instruments or appliances, however small, which is issued by the firm is remarkable for its workmanship. That does not, however, affect its endurance, and a case of Stanley's drawing instruments would enable the donor to be remembered for many a year. Indeed, a clever architect could lead a profitable career with such an equipment. But there are single instruments which are also adapted for presents; and, indeed, one's memory might be kept green by offering one of the pocket compasses. We have so often referred to the variety of instruments for the office and the field produced by W. F. Stanley & Co., it is unnecessary to again treat of the subject. But we may add that new premises have been secured in High Holborn, in addition to those which are well known to architects and engineers all over the world. It is also worth mentioning that Messrs. Stanley can now supply tracing paper, tracing cloths and detail paper of several varieties at moderate prices.

## Coatostone For Interior and Exterior Decorations.

(NEAL'S PATENT) applied to the face of Plaster, Cement, Wood, or other surfaces, lined with mason's joints and blocked out in courses, with indented lines, without cutting into the surface of the work. By this process cannot be detected from Natural Stone.

Coatostone is also easily applied for renovating stonework and acts as a preservative, and to Cement Stucco fronts, giving the appearance of new stone. No scaffolding required, all work done off ladders. For further particulars apply—

The Coatostone Decoration Co., 77 Mortimer Street, W.

## ELECTRIC NOTES.

A SCHEME for the enlargement of the municipal electricity works is to be laid before the Heywood Town Council in a few days. Enlargements are necessary because of the enormously increased demand for current for lighting and for tramway purposes.

THE Wednesbury Town Council have agreed that application be made to the Board of Trade for the revocation of a provisional order obtained by the Midland Electric Corporation for Power Distribution to supply electricity within the borough.

THE Arbroath Town Council have agreed by a majority to make an arrangement with Mr. George Balfour, London, or the company he represents, the undertakers of the electric lighting of the burgh, to light the High Street from Tower-nook to the Public Hall, Commerce Street, Millgate, and West Port as far as beyond the railway station, with arc lamps of 800 candle power, each at 12*l.* per annum, or 1,000 candle-power lamps, each at 14*l.* per annum, to be switched off at eleven o'clock at night, and glow lights of 50 candle power to be provided till daylight, or alternatively, 2*l.* additional for each arc lamp to be kept burning till daylight, it being understood that all expenses for carbons, maintenance or otherwise, be paid by the company, the Council to have the option of using either the 800 or 1,000 candle power lamps. The Council have agreed not to take up the question of lighting public buildings at present.

THE Washington Bureau of Manufacture states, on the authority of Mr. John C. Covert, the United States consul at Lyons, that a very important and far-reaching invention has been announced by which electrical power can be transmitted without the use of wires. It may be called an

extension of the wireless use of electricity, and it is still kept a secret, only one person in Lyons possessing a knowledge of all the facts on the subject. He is a prominent broker who has financed the enterprise. He informed Mr. Covert that all the work in perfecting the invention was carried on in the country at the castle of a prominent manufacturer of Lyons, and that only two persons were permitted to know what was going on. Some two weeks ago the first experiments were tried, and a miniature street car was moved over a flat space by electricity communicated from a distance of several yards. The invention is being tried in Marseilles on a street car line, and applied to several different kinds of machinery.

## VARIETIES.

ON account of heavy outlay on water supplies and sewage works the Yeovil Town Council are unable at present to accept Mr. Carnegie's offer of 2,500*l.* towards building a free library.

THE Royal Choral Society will give on January 1 at the Royal Albert Hall Handel's "Messiah" (with the original accompaniments). The conductor will be Sir F. Bridge and the organist Mr. H. L. Balfour. The band and chorus will number altogether 1,000 performers.

THE death occurred on Saturday at his residence in Sheffield of Mr. Fred Jeckells, one of the best known members of the painting and decorating trade in the north of England. Mr. Jeckells had been in failing health for some time. He was sixty-one years of age.

THE Admiralty have accepted the tender of Messrs. Relf & Son, of Plymouth, for the construction of an oil fuel depôt at Turnchapel, on the eastern side of Plymouth Sound. The depôt will provide storage for 30,000 tons of liquid fuel. The work will occupy about two years.

THE Bishop of Jarrow dedicated a new large quarter chime clock, with two large dials painted and gilt and new bells, to the memory of the third Earl of Ravensworth, and presented by the widow, now the Countess of Mount-Edgumbe. The work has been carried out by Messrs.

**& T. AVERY, Ltd.,** Soho Foundry, **BIRMINGHAM.**

Potts & Sons, Ltd., Leeds and Newcastle, who are also making an illuminated clock for Wallsend town hall, and another for the Mayor and Corporation of South Shields.

THE Prescott Guardians (Lancs) last week instructed their architect to submit an estimate of the cost of the proposed new buildings for male mental cases. At the next meeting a member will move that the previous resolution of the board giving their consent to the expenditure of 9,000*l.* for this purpose be rescinded, and that they be asked to substitute 10,000*l.*

THE December report of the Amalgamated Society of Carpenters and Joiners states that the membership is now 70,259—an increase of 2,361 as compared with the corresponding period of last year, and of 3,322 as compared with February. If the new scheme of amalgamation with the Associated Society is carried, this total will be increased by over 6,000. The voting is to take place next month, and a special effort is to be made to get the necessary two-thirds of the membership to poll.

THE quarry owners in the Carnarvon district have resolved upon further substantial reductions in their price lists of slates. These reductions will range from 5 per cent. to 10 per cent., and will represent a total reduction of about 40 per cent. on the prices which ruled four years ago. It is believed that similar reductions will be made in respect of the Penrhyn, Dinorwic, and Portmadoc slates.

THE water department of the Preston Corporation are confronted with a serious problem owing to a species of fine moss having found its way into the water mains and then into the service mains of houses in different parts of the towns. Whole streets are affected, and considerable inconvenience has been caused, the occupants having to carry water for drinking and cooking purposes from considerable distances.

THE National Association of Master House Painters and Decorators are to visit Birmingham next September for the second time in their history. Since its former visit in 1896 the Association, which was then in its infancy, has become a very powerful organisation. The forthcoming visit will be notable for an exhibition of decorative and applied art, for which purpose Bingley Hall has been taken. One of the features will be an historical exhibition of wall-papers of the last century.

To prevent further inroads of the sea near Sillioth, on the Cumberland side of Solway Firth, the local Council have decided to expend 4,000*l.* in erecting protective walls. At one point the sea had made an inroad 160 yards long and 10 yards wide, and there was imminent danger of further serious encroachment. It is hoped that the Cumberland County Council and other interested authorities will contribute.

THE Caledonian Railway Company are about to commence at Ferryhill, Aberdeen, the erection of new engine sheds, repairing shops, bothies for drivers and cleaners, stores, &c., which have to be completed by May 1 next. The buildings will cover an area of 230 feet in length by 200 feet in width. Messrs. Robert Bruce & Son, builders, Edinburgh, are the contractors for the works, which are to cost about 17,000*l.*

THE scheme for the restoration of Bowden Kirk, N.B., is now practically complete. The church has been continuously used for public worship for 800 years, and in the restoration the old lines will be faithfully followed, and as far as possible the old building will be left untouched. Internally there will be great alterations, but all will be done in accordance with the style and principles of the old architecture. The work (which will cost 1,750*l.*) has been put in the hands of Mr. Macgregor Chalmers, architect, Glasgow.

THE Carnarvon Harbour Trust passed a resolution on Tuesday, the 3rd inst., in support of a petition by local slate merchants asking the Board of Trade to intervene with a view to obtaining a reduction of the new increased Australian tariff on slates, just raised from 15 per cent. to 25 per cent. *ad valorem*. The Harbour Trust have been informed by the Board of Trade that as the result of telegraphic communications the Australian Government had reduced the *ad valorem* duties on slates from this country to Australia from 25 per cent. to 20 per cent. This is not quite a return to the *status quo ante*, but it is a distinct concession, and one that will be largely appreciated in Wales.

At the instance of the Medical Officer of Health, the Corporation of London is bringing to the notice of architects and builders the responsibility imposed upon them in connection with the conduct of building operations which are

likely to involve any disturbance of human remains in the course of excavation. Except where a body is removed from one consecrated place of burial to another by faculty, it is not lawful, the Doctor points out, to remove any body, or the remains of any body, without licence. This prohibition extends to any place of burial, and not merely to burying grounds which have been closed. It has been held, for instance, to be an indictable misdemeanour to enter an unconsecrated burial ground, and, without authority, to dig up and carry away a corpse—"and this even although the person committing the act may have been actuated by motives of affection and respect to the dead, and of religious duty, and have conducted the removal decently."

It has been decided that St. Michael's Church, Coventry, shall be the cathedral of the other new see which it is hoped to create in Warwickshire. Coventry and Lichfield in pre-Reformation times were seats of one bishopric, but the cathedral was burnt in Henry VIII.'s reign. St. Michael's is the second largest parish church in England. Being built by one generation (1373-95), it has a singular unity of its own. Its famous tower rises to a height of 303 feet, the highest of the three tall spires of Coventry. The interior length of the building is 293 feet and its breadth 127, but the lightness of its piers and the breadth of its aisles give it an appearance of much greater size. The chapels which once encumbered the interior are all swept away, leaving it perfectly clear with uninterrupted vistas. On its recent restoration 40,000*l.* was spent.

The Liverpool City Council carried by a large majority an amendment of the fair wage clause in all Corporation contracts, the effect of which is to make the condition much more stringent. It was the complaint of trade unionists that the practice had developed of contractors paying trade union wages and observing trade union conditions merely upon the Corporation work thus obtained, while in all other work and for the rest of the year those conditions were deliberately ignored. It was contended that this was unfair to those employers who observed the required conditions all round and not merely to enable them to secure a particular contract. The amended fair wage clause therefore requires contractors to sign a declaration that they observe trade union conditions and pay trade union wages.

The Sunderland Town Council last week adopted two schemes for providing work for the unemployed. The first was for a West End park costing 15,510*l.*, of which labour would absorb 7,766*l.* The other was for a sea wall at Roker costing 5,500*l.*, the labour to cost 2,623*l.* The Local Government Board telegraphed that they would grant 5,000*l.* to the park and 1,500*l.* to the sea wall. At the same meeting a long discussion took place on the report of the baths committee, who asked for sanction to borrow 3,800*l.*, which is excess expenditure on the building of the new bath at Hendon, for which the estimate was 11,000*l.* The work has been done by the borough engineer and his staff. A sub-committee who had investigated the matter reported that the work had been done satisfactorily, and that the town had got fair value for its money. Many members held, however, that private contractors would have done the work for the original estimate. In the end the report was adopted.

In his annual report to the Glasgow Corporation, Mr. Thomas Nisbet, Master of Works, deals exhaustively with the work of his department during the past year. It states that the net capital expenditure for paving work and repair of streets was 17,667*l.*, or 3,617*l.* over the amount authorised. The increase was occasioned by experimental paving laid in Saracen Street and by the paving of various portions of roadways which had been widened, neither of which had been provided for in the estimates. The estimated ordinary expenditure for the repair of streets, &c., was 86,204*l.*, and the estimated receipts 19,845*l.*, making an estimated net charge against revenue of 66,359*l.* The actual expenditure amounted to 96,471*l.*, and the actual receipts to 17,495*l.*, or an actual net charge against revenue of 78,976*l.* Reference is made to the improvements effected in a large number of streets, and it is added that negotiations for many improvements are still pending. The following is the statement of notices received for openings to be made in the streets by Corporation departments, &c.:—Corporation Water Department, 1316; Corporation Gas Department, 475; Electric Lighting Department, 1201; Telephone Department, 45; Post Office Authorities, 141; proprietors, under bonds, 2,156*l.*—total, 5,334.

THE Royal Commission on Canals and Waterways have recently obtained Treasury sanction for an inquiry into the probable cost of improving the canals and waterways connecting the Midlands with the Thames and the Humber. Unless the results of this inquiry lead the Commission to reconsider their scheme, the investigation as to cost will not stop with these two routes, but will be extended to two more—namely, those connecting the Midlands with the mouths of the Mersey and the Severn. Sir John Wolfe Barry and Partners have undertaken the investigation on behalf of the Commission. The estimates as regards canals will be for two or three alternative gauges, of which the smallest will be a canal with locks capable of accommodating not only barges carrying 100 tons, but also multiples of smaller canal boats.

In the Sheriff Court at Kilmarnock a joiner of Grangemouth recently sued a restaurateur at Ardrossan for 41*l.*, the balance of the price of the joiner work of a tenement of houses in Grangemouth executed for the defender. The estimate for the work was 432*l.*, and the cost was 473*l.* The defenders dispute the balance sued for on the ground that some of the woodwork was disconform to contract. Sheriff-Substitute Mackenzie allowed a proof as to the disconformity to contract of certain extra work performed by the pursuer. On Friday last the First Division recalled the judgment of the Sheriff-Substitute, and remitted to him to allow a proof, not on the question of disconformity of work to the contract, but on the question of whether the extra work was ordered by the defender's architects. The court was satisfied that the architect employed by the defender was put forward by the latter to represent him in the contract; that the architect, who was the proper judge of such matters, had expressed himself as satisfied with the work done and had certified it; and that the only question was whether the architect had authorised the extra work in question. The Sheriff-Substitute was directed to dispose of the expenses of the appeal according to the result of the cause.

A FEW months ago a bulge was noticed in the exterior face of the north wall of the vestibule and staircase of the ancient Guildhall of Norwich. It was found that, instead of the defect being local, a large portion of the wall was in a bad condition, and that the outer face had separated from the inner face, leaving a large cavity. The wall was shored

from the outside and tied to the western wall internally. The floors and the roof were shored from the basement, and a commencement made of taking down the defective wall from the top, but although about three-quarters of the height of the defective wall has been taken down, no sound work has yet been found on which to rebuild. The city engineer is quite satisfied from an engineering point of view of the proper steps to be taken, yet, seeing the archæological interest of the building, he thought it would be advisable to consult some person thoroughly acquainted with dealing with repairs to heavy old buildings. Accordingly it was decided to call in Messrs. Thompson & Co., ecclesiastical builders, of Peterborough, and one of the specialist members of that firm will make an inspection. The whole wall has been found to have a decided tremor at the passage of every tramcar. The mortar, as far as the work has been pulled down, has crumbled to pieces, and most of the flintwork can be removed without difficulty with bare hands.

#### COLLEGE OF SCIENCE, DUBLIN.

IN reply to a letter from Mr. William Field, M.P., in reference to the new College of Science for Ireland, the Secretary to the Commissioners of Public Works states that the statement that 40,000*l.* out of a contract for 110,000*l.* will be spent on Portland stone is a grotesque misrepresentation, if it means expended on Portland stone as delivered in Dublin, and a gross exaggeration even if it means expended on the material worked and fixed in its position in the building. The total sum to be paid for Portland stone, including material, delivery, working and fixing is very considerably less than 40,000*l.*, and that of that reduced sum probably not one-third is attributable to the cost of material and delivery in Dublin, the remaining two-thirds being for work to be done in Dublin. The Board are satisfied that Portland stone is suitable to Dublin atmospheric conditions, and trust there will be an end to the controversy regarding the merits of that material and Mountcharles stone. Mr. Field, in reply, states that even if Portland stone were suitable, there is no need to import material when there is such an abundance of native stone to choose from, and says he will later on ventilate the grievance in Parliament.

## PROPERTY IN FEUDAL TIMES.

A LECTURE was delivered by Mr. G. J. Johnson in Birmingham on "The Statute of Uses A.D. 1535: its Causes and Consequences." He said the old form of transferring land was very different from that in use at the present day. In the old days people thought little about title, the reason being that the possessor of the land only held it for his life, and he could not dispose of it without the consent of his lord. What they thought of first, last and before everything else was possession. And the possession of freehold land was technically known as seisin. One would have thought that the importance of seisin had been effectually done away with by the Real Property Act of 1845, but last April a case occurred which, by reason of the judgment of the late Mr. Justice Kekewich, was likely to raise a storm in a teacup. According to the old practice publicity was required. If a man wanted to obtain possession what did he do? He and the purchaser walked to the land to be conveyed, and in the presence of neighbours the possession was solemnly delivered from one to the other. The law in the old days was dead against the secret practice which had obtained since the Statute of Uses. They wanted to know who was the man in possession, and he was required to be a man who could render feudal service. If he could not fight he had to pay. Indeed the old feudal system could be described as a territorial force. It brought in its train unbearable burdens on every feudal tenant, and at last relief was sought by severing the beneficial interest from the legal interest, and vesting the beneficial interest in a body of trustees in trust for the legal owner or his heirs. This idea received the cordial approval of the ecclesiastic, but met with the bitter antipathy of the barons, whilst the common lawyers who were accustomed to deal with the seisin of land could not stand the new-fangled notion at all. It was a metaphysical proposition; it was beyond something which could be seen or felt. Being free from feudalistic restrictions it could be moulded in any direction. The evil results of the divided interest were set out at length in the preamble to the Statute of Uses by which the seisin was converted to the use. It transferred what was now called the legal estate from the man who held the common law ownership to the man who

was to have the beneficial interests. And no use could be declared after the first use, and then there came the difficulty as to what source the seisin to serve any subsequent shifting use came from, seeing that the first use had been executed and therefore exhausted. To overcome this they set up a little doctrine known as "Scintilla juris," which meant that there was a spark remaining behind which could be called into effect by another use being substituted for the first. This "scintilla" kept cropping up now and then, and was the subject of much debate, but the "Act to Amend the Property Act of 1860" quite settled it for ever. In conclusion, Mr. Johnson urged the imperative necessity for legislation to render unnecessary reference to the piecemeal alterations of the last 400 years, and really to simplify the law of real property.

## AQUEOUS SUBSOIL OF LONDON.

A PAPER on "The Buried Rivers of London" was read by Mr. J. George Head before a meeting of the Auctioneers' Institute of the United Kingdom on Saturday. London builders, he said, have frequently to carry their foundations down, either on piers built with hydraulic cement or on wooden piles treated with some damp-resisting preparation, through the saturated stratum until a firm basis is found. Examples are known where foundations have been carried down as far as 80 feet below the surface before a satisfactory base could be obtained. They might be able to see why water should be so plentiful if they considered for a moment the geological formation of the London district; it lay in a shallow, trough-like depression of the great chalk formation, which came to the surface at Rickmansworth on the north and Purley on the south. In this trough they had, resting on the chalk, a porous stratum called the London tertiaries, consisting of mixed sands, clays and pebbles; over this there was a dense bed of the London clay. This clay extended from Rickmansworth as far south as Mitcham, and varied in thickness from 400 feet downwards; at Kentish Town it was 236 feet, at Oxford Street 64 feet and at Mitcham it thinned out to nothing. On the top of all this they had a bed of sandy gravel extending on both sides of the Thames to a total width of about five miles.

West End—166 PICCADILLY, W.

North and south of this sandy strip rose the clay hills, which on the northern side were capped with Bagshot sand. There were also patches of gravel, sand and boulder clay scattered all over the clay area. The lines of junction of the different rocks would facilitate the percolation and accumulation of water underground and the formation of shallow springs, which would feed the various streams. It would also be seen from the trough-like shape of the basin that much of the chalk lay higher than the superincumbent clay and sand, so that the water which was so abundant in the chalk would tend to rise round the edges of the clay or wherever it could effect a passage to the open air. That this was so was evident from the chalybeate and saline nature of the springs, indicating a deep and distant origin. The drainage of London had, of course, greatly lessened the quantity of these springs, and as far as external evidences went had altogether removed nearly all of them, a few only remaining, such as the spring in Well Walk, Hampstead, which still ran and in which the chalybeate taste was markedly discernible. The Roman Bath in Strand Lane still delivered 7,000 gallons daily. The horse trough in Cornhill was a familiar object, and was supplied by a spring which was described by an inscription on the trough. Doubtless there were others, but the majority had vanished. The watercourses were filled up and built over, the soakage which supplied the surface streams had been diminished by the drainage system, and where streams were fed by deep springs they had been enclosed in sewers specially constructed—the Ranelagh sewer for the Westbourne, the King's Scholars Pond sewer for the Tybourn, and the Fleet for the Holebourn. But though they might imprison the main stream of a river in a sewer, they could not do so with its innumerable tributary rivulets. The brook in its course would be joined by many springs and rivulets which could not enter the closed sewer, and these, if they still ran, must be finding their way underground, and probably along the original course of the stream. Doubtless numerous instances would occur to many surveyors of the abundant presence of water under buildings, and it would be most interesting to note whether the situation was near the old channel of one or other of the London streams. He thought that in most instances this would be found to be the case—indicating that, in addition to the main streams flowing along the

sewers, there were trickling rivulets of pure water buried deep under our feet, creeping along the old channels, to which they clung with quiet persistence. They were the ghosts of the rivers that once beautified the environs of London town, and in the words of the old historian, "whose sweet, wholesome and clear waters flowed rippling over the bright stones."

### PRODUCTION AND PREVENTION OF SMOKE.

A LECTURE was given by Mr. J. W. Graham, principal of Dalton Hall in the University of Manchester, before the members of the Birmingham Ruskin Society, on "Smoke: its Production and Prevention." Describing the smoky condition of English cities, Mr. Graham observed that the present condition of our towns represented a state of transition. He could not believe that the industrial districts of England would, or could be, always as they are. The work of the twentieth century must be to adjust the needs of the works to the needs of the workers. We choked and coughed and slipped about under the constant irritation of our city atmospheres, and some of us took to drink in consequence. We knocked up against the smoke question in almost every effort made for the people's good, temperance included. Unfortunately, our climate was such that smoke was not only an evil in itself, but an evil because of the fog which it caused.

Speaking of the effect of smoke on climate, Mr. Graham said he felt that we should never have again in England the kind of weather there was half a century ago. Ruskin seriously believed that the weather of England had changed for the worse during his lifetime. He declared that a change began to come over the weather of England about 1871, and it was a curious fact that that was the first year for which we had a record of our coal consumption. We now burned twice as much coal as we did then. France and Germany had become almost entirely industrial. Switzerland was completely industrial. So that the effect of smoke on climate was a European phenomenon. He believed we were entirely altering the face of the sky. There was in the atmosphere an accumulation of carbon which seriously affected the whole of our weather. The solution of the smoke difficulty, he thought, would be found

in the direction of the use of gas, which was by far the most economical way of making power. The substitution of gas-engines for steam producers would reduce our coal bill for obtaining power by one-fifth. People all over England were no doubt well alive to this fact, and a change was going on. He had no doubt that before a generation was over the use of improved gas-engines would come more and more into vogue. It was well to make this change on another ground. The public did not realise how relatively near we were to the exhaustion of our coal supply. From calculations given in the appendix to the report of a Royal Commission, it appeared that if we estimated that the population would go on increasing with the corresponding decrement that had been observed since 1870, the coal beds we know of would be exhausted in 209 years from the present time. We had at present 100,000 million tons of coal, and there were 40,000 million tons supposed to be in the unproved coalfields which probably existed. These additional coalfields would keep us going for about another eighty years. It was certain that long before the coal was nearly exhausted a great rise in price would take place. Coal famines were becoming more and more frequent, and the return to normal prices after these famines became less and less strong. Prices would rise until they were checked by the importation of coal. Before the present century was over we would be in the midst of a severe coal famine, and as regards price England would be in the position of a country which had to import its coal from abroad. That was a very serious thing for our manufactures and even our Empire. London would get a living by hotel-keeping and as the resort of fashion, and Birmingham would become a place of interest for its old town halls and picture galleries. If there was nothing to take the place of coal—and a Royal Commission said there was nothing in sight to take its place—our Empire and our navy would be destroyed. In the face of such a situation the necessity for economy in coal consumption was paramount. But we went on wasting our coal, so that on the average only one hundredweight out of every ton was turned into effective heat. Ten horse-power worth of gas was wasted for every ton of pig-iron made. A great part of this waste could be saved by the use of gas for power purposes. There was no doubt also that domestic smoke could very largely

be obviated by the use of gas. The domestic smoke question was the worst part of the problem. The thorough cure for the evil was the gas stove; but he hoped that before long we should be able to point to coalite as a solution of the fuel difficulty. Coalite was a perfect cure for smoke, and if it or any of its rivals could be sold at a reasonable price a solution of the domestic smoke question would be obtained. In the meantime our domestic grates should be reasonable ones. They should be constructed on the principles carried out by Dr. Teale, of Leeds. The grates should be firebrick fireplaces, with open slanting cheeks and a back sloping forward over the fire. The direction of the draught should be over and not through the fire. The man who used more gas than his neighbour was a public benefactor, because he produced less smoke. Therefore gas should not be sold at a profit by municipalities, and in the coal districts should not cost the consumer more than 1s. 6d. or 2s. per 1,000 cubic feet. As to manufacturing smoke, owing to the mechanical stokers available, there was no need for it anywhere. Mr. Graham added that for the purposes of smoke prevention an amendment of the Public Health Act was needed, and the business of smoke prevention should be taken out of the hands of local authorities. With the appointment of central inspectors, egged on by the Local Government Board, who should have increased powers, we should probably get the Act carried out. At present it was a dead letter, except in London and seven provincial towns.

### LUSTRED POTTERY.

An address on the methods of true lustred pottery decoration was given last week before the Northern Art Workers' Guild in the Manchester Municipal School of Art by Mr. William Burton, the director of the Pilkington pottery at Clifton Junction and the historian of porcelain. For some years past, Mr. Burton said, according to the *Manchester Guardian*, we have been doing something to carry forward the old processes of lustred pottery. In so doing we had learned many things about the methods of the old potters who used that form of decoration centuries ago. We had learned what they did and why they did it, and how they got the effects, beautiful, subtle and strong, and very dif-

# CABOT'S INSULATING AND SOUND-DEADENING QUILT

PREVENTS THE TRANSMISSION OF SOUND through walls and floors by absorbing and breaking up the sound waves. No other Deafener does this.

KEEPS OUT HEAT OR COLD exactly as do the feathers of a bird; providing innumerable minute dead-air spaces, giving highest insulating power. Will save enough fuel in a single Winter to pay for itself. Keeps a room warm in Winter, cool in Summer. DECAY, MOTH, AND VERMIN PROOF, AND UNINFLAMMABLE.

Scientific investigation has proved that for HEAT INSULATION or SOUND-DEADENING the highest degree of efficiency, with economy in cost and extreme durability, has been attained by CABOT'S QUILT.

ferent from many of the things that have been used since. Lustred pottery possessed one prominent feature in common, and that was a shining metallic quality of surface which marked it off from every other kind of pottery decoration, though this quality was more or less manifest in all the decorations of this class produced during the last thousand years. The so-called copper and silver lustres of English pottery were introduced a little more than a century ago. Here the metallic quality was developed to the utmost, for pottery covered all over with such lustres as these recalled at once the characteristic appearance of vessels shaped in metal. There could be no doubt that the English potters of the late eighteenth and early nineteenth century thought they had discovered a delightfully simple method of making their pottery look like metal and resembling vessels made in gold or silver. They endeavoured to imitate the popular Sheffield silver plate of that day. Unconsciously, they seemed to have been following the example of the first inventors of the lustre decoration, for there was no doubt that the potters of Egypt, Syria and Persia, who made the first "lustres," also hailed their invention as a brilliant discovery that enabled them to make pottery like gold.

It was interesting to recall how soon the newly discovered metal platinum was brought into use for lustred pottery. Just as it was found that gold-chloride solution would furnish a coat of shining gold, one of the first industrial uses of platinum was its application in a similar way to produce a shining deposit of platinum on crockery, which was known by the common name of silver lustre because of its resemblance to that metal in appearance. Wedgwood was one of the potters who made extensive use of these gold and silver lustres. If we examine examples of the fine lustres of the Persian, Spanish or Italian potters we should find that the decoration, however strong and metallic it might be in certain lights, was softened and beautified by a wonderful play of iridescent colour, so that it assumed something of the changing quality of the inside of a pearl shell.

The only form of pottery decoration which ought to be called lustre was that which exhibited besides the metallic sheen this play of iridescent colour, and in Mr. Burton's opinion it would be better if our so-called English lustres

made with a basis of gold or platinum were described as "plated" or "metallised" pottery, so as to avoid the confusion of treating these not very artistic products as if they belonged to the same category as the splendid lustres of old time. Mr. Burton described the process of true lustre, and said that after it had reached a high pitch of excellence in Spain and in Italy it fell into almost complete disuse in Europe, and had only been revived since about 1860. Where the method was originally invented was by no means certain. He could only say that it was probably invented by Egyptian, Syrian or Persian potters working for the Arabs, and that it was extensively adopted by the Spanish potters, and especially by the Moorish potters of the south and east of the Peninsula, and afterwards conveyed to Italy.

Certain interesting effects, Mr. Burton said, had been brought to light in their works at Clifton Junction, Manchester. A great deal had been said as to certain glazes being much better for the lustre process than others. They had found it possible to produce excellent lustres on glazes of every type—leadless glazes, lead glazes and glazes with or without oxide of tin. The value of the lustre process depended entirely on the artistic use of it. Having reduced the scientific and mechanical sides of the process to something like order and method, they endeavoured to produce a new English pottery as artistic and beautiful as that of the Middle Ages. To this end they had gathered together a school of young English artists, all of whom had had some training in various art schools of the country under the control of the Board of Education. Every piece of lustre pottery they produced was unique, for either the designs were original conceptions or adaptations of the painters themselves. In cases where they had been fortunate enough to obtain designs from distinguished decorative artists like Mr. Walter Crane no two pieces were reproduced in the same way.

Some excellent examples of the work done at the Clifton Junction Pottery were on view in a case at the School of Art. Some pieces of lustre ware from the Victoria and Albert Museum were also lent to Mr. Burton by the Board of Education, while the lecturer showed a collection of pieces by Clement Massier, Jerome Massier, Cantegalli, De Morgan and others.

**EDITORIAL NOTICES.**

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

**TENDERS, ETC.**

\*\* As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

**COMPETITIONS OPEN.**

RADCLIFFE.—Feb. 3.—The Radcliffe Urban District Council invite architects practising in Lancashire to submit designs and estimates for Council offices. Premiums of 75*l.*, 50*l.* and 25*l.* offered for designs placed second, third and fourth. Mr. G. H. Willoughby will act as assessor. Mr. S. Mills, clerk, Council Offices, Radcliffe, Manchester.

ROCHDALE.—Feb. 1.—The Corporation invite designs for branch baths to cost not more than 7,500*l.* Premiums of 25*l.*, 15*l.* and 10*l.* An assessor will be appointed. Send 10s. 6*d.* to Mr. S. S. Platt, borough surveyor, Town Hall, Rochdale.

**CONTRACTS OPEN.**

AUDLEY.—Dec. 31.—For proposed Council schools at Talke and Butt Lane, in the parish of Audley, near Newcastle, Staffs, for 300 and 400 children respectively. Deposit 1*l.* 1s. Mr. Graham Balfour, director of education, County Education Offices, Stafford.

BANHAM.—Jan. 10.—For alterations and additions at the Banham school, Norfolk. Deposit 10s. Mr. E. J. Tench, architect, Royal Insurance Buildings, Upper King Street, Norwich.

BECKENHAM.—Jan. 6.—For extension of the destructor house at the electric light works, Church Fields Road. Mr. John A. Angell, surveyor, The Beckenham Urban District Council, Kent.

BILSTON.—Jan. 18.—For erection of new schools at Bull-holes, Bilston, consisting of boys', girls', infants', and senior boys' and girls' departments, for 1,350 children, with out-offices and boundary walling. Deposit 1*l.* 1s. Messrs. Bailey & McConnal, architects, Bridge Street, Wallsall.

BIRMINGHAM.—Jan. 21.—For erection of a Council school in Leigh Road, Washwood Heath. Deposit 2*l.* Finance Office of Education Department, Edmund Street, Birmingham.

**LUXFER SASH CANOPY SKYLIGHT PAVEMENT PRISMS**

Specialties:—Fire-resisting, Ornamental and Roof Glazings. Dome Lights, Ceiling Lights, Lantern Lights, Floor Lights, Stallboard Lights, &c., &c.

The British Luxfer Prism Synd., Ltd., 16 Hill St., Finsbury, E.C.

**BLAYDON AND CHESTER-LE-STREET.**—Jan. 7.—The Durham County Council invite sole tenders for new council schools at Blaydon and Chester-le-Street. Plans, specifications and general conditions of contract can be seen and bills of quantities obtained as follows: (1) for Blaydon school—at the office of Mr. J. Morson, 77 Westgate Road, Newcastle-on-Tyne; (2) for Chester-le-Street schools—at the office of Mr. W. H. Knowles, 25 Collingwood Street, Newcastle-on-Tyne.

**BRIDGNORTH.**—Dec. 31.—For erection of a secondary school at Bridgnorth, Salop, to accommodate 200 pupils. Deposit 1*l.* 1*s.* after December 12. Messrs. Pritchard & Pritchard, architects, Kidderminster.

**BRISLEY.**—Dec. 28.—For improvement and enlargement of Brisley Church of England schools, East Dereham. Rev. W. H. Lowe, Brisley Rectory, East Dereham.

**CASTLEFORD.**—Dec. 31.—For whole or part tenders in erection of a dual secondary school at Castleford, Yorks. Deposit 1*l.* Mr. W. S. Braithwaite, architect, 6 South Parade, Leeds.

**COCKFIELD.**—Dec. 31.—For erection of a temperance institute. Mr. James Howe, Cockfield, S.O., co. Durham.

**COVENTRY.**—Jan. 1.—For work required to be executed and materials supplied in erection of corn exchange and shops, Smithford Street. Deposit 1*l.* 1*s.* Mr. J. E. Swindlehurst, city engineer and surveyor, St. Mary's Hall, Coventry.

**DEVONPORT.**—Dec. 31.—For erection of laundry at the workhouse. Messrs. Thornely & Rooke, architects, 29 St. Aubyn Street, Devonport, or 11 The Crescent, Plymouth.

**DOVER.**—Dec. 30.—For carrying-out structural alterations to the St. Martin's Council schools in Markland Road, Maxton. Deposit 1*l.* 1*s.* Mr. W. C. Hawke, A.M.I.C.E., borough engineer, Maison Dieu House, Biggin Street, Dover.

**EARLSHEATON.**—Jan. 13.—For pulling-down and re-erecting retaining and other walls, flagging footways, kerbing, channelling and draining of High Road, Earlsheaton, Yorks, for the tramway route. Deposit 1*l.* 1*s.* before Dec. 31. Mr. J. H. Ward, surveyor, the District Council Offices, Earlsheaton.

**EGGLINGHAM.**—Jan. 6.—For erection of a villa at Eggingham, near Alnwick. Mr. M. Temple Wilson, architect and surveyor, Alnwick.

**FOLKESTONE.**—Jan. 1.—For erection of elementary school in Chart Road. Deposit 1*l.* 1*s.* Mr. F. Newman, architect and surveyor, 4 Bouverie Street, Folkestone.

**FULMER.**—Jan. 1.—For erection of elementary school at Fulmer, Bucks, to accommodate about ninety children. Mr. W. C. G. Watkins, secretary, Education Office, Aylesbury.

**GOOLE.**—Jan. 8.—For erection of a school with caretaker's house. Deposit 1*l.* 1*s.* Mr. W. T. Silvester, clerk to the Governors, 10 Victoria Street, Goole.

**GREAT DRIFFIELD, &C.**—Jan. 3.—For the following works, for the West Riding education committee:—(1) Additions and alterations to the Council school, Great Driffield; (2) additions and alterations to the Council School, Wold Newton; (3) enclosing and forming playground at the Council school, Withernwick. The Building Surveyor, County Hall, Beverley.

**GREAT HARWOOD.**—Jan. 7.—For erection of public elementary school and technical instruction block at Great Harwood, near Blackburn, to accommodate 900 scholars. Deposit 2*l.* Mr. Henry Littler, county architect, 16 Ribblesdale Place, Preston.

**GREETLAND.**—Jan. 8.—For mason (labour only), joiner, plumber, slater and plasterer's work in erection of fifteen through houses off Clay House Lane, Greetland, Halifax. Messrs. Richard Horsfall & Son, architects and surveyors, 22A Commercial Street, Halifax.

**GRIMSBY.**—Jan. 3.—For erection of a public convenience in Riby Square behind Messrs. Waby & Co.'s premises. Separate tenders for the sanitary fittings and appliances. Deposit 1*l.* 1*s.* Mr. H. Gilbert Whyatt, A.M.I.C.E., borough engineer and surveyor, Town Hall Square, Grimsby.

**GRIMSBY.**—Jan. 3.—For erection of a head post office. Deposit 1*l.* 1*s.* H.M. Office of Works, &c., Storey's Gate.

**HASTINGS.**—Jan. 2.—For erection of a covered way at the workhouse, Frederick Road. Messrs. A. W. Jeffery & Son, architects, 5 Havelock Road, Hastings.

### A. SLATE CLIP.

SLATES in roofing have not to endure much of a strain except what arises from wind power and from the weight of snow. But the inclination of a roof makes them liable to the power of gravity which causes them to become loose

Clip Company is not only cheaper than lead, but it is neater and more effectual. First is laid down a locking clip which is nailed to the battens. It has holes for nails and a slit in it is intended to receive the clip. Both strip and clip are made of tin and have therefore sufficient

elasticity. The clip is  $\perp$  formed and made out of one piece. The vertical part, which, of course, is doubled, is cut to receive the slate, which is held securely, although there is no chance of breakage through expansion, contraction or other cause. Theoretically the arrangement is ingenious; and as the clip has been used by railway companies, owners of breweries and other large establishments, experience has confirmed the conclusions which can be drawn from a single specimen.

THE Mansfield Town Council last week gave a general approval to the sewerage scheme submitted by the engineers, and resolved that application be made to the Local Government Board for sanction to borrow 38,000*l.* for

and to slide. In some French buildings precautions are taken which are enough to suggest that slates are hung rather than laid. The English system, by which slates are held in position by nails, is not always satisfactory. To increase the safety lead clips have been used, especially where roofs are repaired. The new clip of the Lock S'ate

works of sewerage disposal, repayable in 50 years, and that the borough surveyor, Mr. R. F. Vallance, be paid 1,500*l.* for his services in carrying out the scheme, including quantities up to 38,000*l.*, 700*l.* to be paid at once, 300*l.* when the loan is received, and remainder as the work progresses.

### The "MASTA" Patent Improved

## PARTITION BLOCKS AND CEILING SLABS

Are manufactured chiefly of Stourbridge Fireclay, making them absolutely **Fireproof and Sound-proof**, and **Exceptionally Light in Weight**. **Fibrous Ceilings** made of same material.

## TRADE NOTES.

UNDER the direction of Mr. Ernest Collier, architect, Carmarthen, the "Boyle" natural system of ventilation, embracing the latest patent "air-pump" ventilators, has been applied to the National school, Ferryside.

THE infectious diseases hospital, Leuchars, is being warmed and ventilated by means of Shorland's patent Manchester grates and special inlet ventilators, the same being supplied by Messrs. E. H. Shorland & Brother, of Manchester.

WE have been requested to announce that Messrs. Field & Sons, auctioneers, surveyors and estate agents, of 54 Borough High Street, London, S.E., who took into partnership Mr. William Glasier in 1903, have added his name to the firm, and that in future it will be known as Field, Sons & Glasier.

THE Edison & Swan United Electric Light Co., Ltd., are supplying a new type of lamp which they have named the "Black-Cap." The lamp, which bears the well-known trade mark "Royal Ediswan," is further distinguished by an illustration of a bird, and the words "Black-Cap" etched on the bulb. Briefly, the lamp has been placed on the market to meet the demand for a high-grade lamp, of standard pattern, suitable for use in all exposed situations, where the ordinary type would be unreliable owing to corrosion from damp or chemical fumes. The lamp is specially suitable for use in such places as mines, chemical works, breweries, laundries, cellarage, and all similar places where the lighting is exposed to either damp or fumes which would have a corrosive effect on the lamp caps, if left unprotected with the exception of the ordinary lacquering. The cap of the new type is enamelled with an acid and waterproof enamel of high flexibility and insulating qualities, and in addition to the protection afforded by this, the cementing of the cap to the bulb is effected by means of a waterproof cement, thus rendering the lamp absolutely impervious to moisture or fumes. For outdoor use, as street lighting, these lamps should be invaluable, as no special precautions are necessary to render the fitting waterproof. The usual form of water-tight fitting hitherto necessary can be modified if required where these lamps are used, as the advantages of the lamp

itself are so great. We are informed that in all details regarding insulation, the lamp more than conforms to the standard requirements and may be implicitly relied upon.

## VARIETIES.

A FURTHER public library is to be erected for the Urban District Council of Ilford, Essex, in Balfour Road. The plans are in course of preparation by the surveyor.

MR. BASIL PYM ELLIS, aged fifty-seven, of Bevendean, Oxshott, Surrey, engineer, a partner in the firm of John Aird & Co., son-in-law of Sir John Aird, M.P., left property valued at 207,385*l*.

MESSRS. BROWN & SONS, of Salford, have commenced the work of the foundations for the large offices of the Royal Liver Friendly Society in Liverpool. Their tender for that part of the work was 31,500*l*.

THE Urban District Council of Wood Green, London, have decided to make application to the Local Government Board for sanction to borrow 22,000*l*. for the purpose of purchasing land for a public park, sites for a secondary school, for a new fire station and for an elementary school.

MR. CHARLES CARTER, architect, of Nottingham, has been awarded the first premium for the new municipal offices for the Corporation of Hereford, the cost of which is not to exceed 3,500*l*. Messrs. Baines were placed second in the competition, for which there were ninety-eight entries.

At a meeting of the Hanley Council the chairman, in moving the minutes of the sanitary committee, referred to the great progress made in the gas fires of the potting ovens in the district, and declared there was no doubt now that they were within reasonable distance of a smokeless potteries.

MR. HENRY BIGGIN, of Sheffield, was elected president of the Yorkshire Builders' Federation at the annual meeting at Hull on the 19th inst. Mr. Biggin is a member of the firm of Messrs. Ash, Son & Biggin, builders and contractors, and is recognised as one of the leading men in the trade in Sheffield and district. He has been president of the Sheffield Builders' Exchange since its inauguration. Mr. A. J. Forsdike, of Sheffield, is treasurer of the Federation.

C. AMOS, 11 Queen Victoria Street, E.C.

THE Waterford Corporation last week acquired the Waterford toll bridge and ferry rights over the river Suir, a cheque for 63,885*l.* 17*s.* 9*d.* being handed over to the bridge proprietors in full discharge of all claims. The bridge will be free from January 1, and it has been decided to invite Mr. John E. Redmond, M.P. for the city, to attend the demonstration at the throwing open of the bridge on the night of December 31.

At Edinburgh the residential agricultural and sporting estates belonging to the Earl of Galloway in Wigtownshire were offered for sale by public auction on the 18th inst. The upset price was 487,000*l.* There was a large attendance, but there was no offer, and the sale was adjourned. The estates include the historic mansion of Galloway House.

A SUB-COMMITTEE of the general purposes committee of the Birmingham City Council considered the tenders received for the excavations, foundation and the construction of the lower ground floor of the building to be erected on the site between Edmund Street and Great Charles Street as an extension of the Council house. It was decided to recommend to the full committee the acceptance of the tender of a local firm.

A NEW town hall is to be built for the Bethnal Green Borough Council at a cost of 20,000*l.*, the site selected being in Cambridge Road, at the south-east corner of Patrick Square, within two minutes' walk of Cambridge Heath station. It has a frontage of about 80 feet to Cambridge Road and of 133 feet to Patrick Square, the total area being 11,000 square feet. The surveyor's estimate of the cost is 22,100*l.*, including provision for an adequate supply of appropriate furniture.

A REPORT on the subject of the unemployed has been submitted to the works committee of Dundee Town Council by Mr. James Thomson, the City engineer. He states that on November 26 twenty cards offering work were issued, and on the 27th the work was commenced, 13 men accepting the offer of work. Having regard to the small number who responded to the invitation, a further 10 work cards were issued on the 28th, and of these five only availed themselves of the offer; and again on December 3 ten additional offers of work were sent out, and of these only

three men turned out. Of the total number of 40 invitations for work there are at present 13 men working.

A DEPUTATION of London managers of the Theatrical Managers' Association waited upon the committee of the Metropolitan Water Board for the purpose of pointing out the enormous charges made upon them in respect of water rates, which are likely to be increased owing to the new law coming into force on April 1, 1908.

THE markets committee of Edinburgh Town Council recommend the adjustment of the plans for the new slaughter-house at Gorgie in accordance with an arrangement arrived at with the butchers' representatives, and to ask for a remit to obtain estimates for the work. The same course was adopted with regard to the plans for the corn market, in relation to which a petition was received from farmers, corn-dealers, and others, asking that the erection of the new premises should be proceeded with simultaneously with the cattle market and slaughter-house.

THE provision of a commercial pier near Langney Point, close to Eastbourne, is contemplated. It is estimated that the cost of this work will be about 60,000*l.* The site is about 1½ mile east of the town and close to the Corporation gasworks and the Corporation electric power station. The proposed works consist of two arms; the eastern arm, about 1,200 feet long, will be the landing stage, and will provide a depth of 30 feet to 35 feet at high water ordinary spring tides. The western arm, 1,000 feet long, will form a wave screen or breakwater for the protection of vessels discharging at the landing stages. In rough weather these vessels will lie to moorings and will be served by long-reach cranes. The deep-water structure will be built exclusively of armoured concrete, portions of the approaches being of timber. The engineer is Mr. A. E. Carey, M.Inst.C.E.

THE Liverpool Corporation propose to promote a "Streets and Buildings" Bill, which suggests that additional provisions and further powers should be granted to the Corporation with regard to streets and buildings in the city of Liverpool and to the laying out and development of estates for building purposes; provisions as to new and existing streets; power to the Corporation to purchase and sell lands; adjustment of boundaries and exchange of lands

between owners of neighbouring lands; rights of land-owners and building owners in and over lands and buildings of neighbouring owners; increase of width to which new streets must be laid out; restrictions as to value and character of buildings to be erected on certain areas; by-laws exemptions; establishment and powers of standing arbitrator or other tribunal; penalties; demolition of buildings; repeal, amendment and extension of Acts; general and incidental provisions.

THE Board of Trade recently issued the fourteenth annual report dealing with the change in the rates of wages and in the recognised hours of labour of the workpeople in the United Kingdom. The particulars relate to 1906 and the first half of 1907. The statements as to wages of course refer to the recognised rates per week or day and do not attempt to represent the actual earnings. The upward tendency in wages which commenced in the second half of 1905 continued throughout 1906, showing, for the first time since 1900, a total net increase in wages as compared with the preceding year. The changes in rates of wages during 1906 resulted in net advances in all the principal groups of trades, with the exception of building and quarrying. Of the 5,140 workpeople whose wages were reduced, 2,400 were engaged in quarrying and 2,200 in the building trades. Of the workpeople whose hours were changed, 18,400 (or 33.5 per cent.) were in the metal, engineering and shipbuilding trades, and 14,400 (or 26.5 per cent.) were in the building trades. The 14,400 workpeople in the building trade group include nearly 4,800 operatives at Bristol, 4,000 plasterers in London and 2,700 carpenters and joiners at Glasgow.

THE Local Government Board has reopened the question of the purchase of the electricity works by the Dover Corporation on an application for a further loan. The Board, in a letter submitted to the Council on the 18th inst., states that an investigation of the accounts shows that there has been an increasing annual loss during the period that the works have been carried on by the Corporation. The purchase price appeared to represent the cost price of the works, which had been in working for seven years, and goodwill representing 52.370%. The Board wished to know who advised the Corporation as to the

price and on what information the valuation was made. On the information before them they were of opinion that the advice on which the Corporation acted was entirely mistaken, and that the company in consequence received a sum considerably in excess of the value of the undertaking. The Board asked to be furnished with all documents. The Corporation last week ordered a reply that the loss is greatly due to the fact that, though they asked for a loan for forty-two years, the same as given to Metropolitan boroughs, they were only allowed thirty-five years. The Council were reluctant to raise the price of the current, though in Hastings and Eastbourne it was 20 per cent. more than in Dover. Copies of the engineers' and valuers' reports were ordered to be sent.

A SERIES of experiments to demonstrate the relative speeds of electric and steam locomotive trains have recently been made upon a six-mile stretch of the New York Central Railway. The two trains, identical in weight, ran side by side upon an ordinary railway track with easy gradients and curves of average radius. Both the steam and the electric locomotives were of the latest design, the former weighing 108 and the latter 90 tons. In the first run the electrically hauled train came in two lengths ahead, and reached a maximum speed of fifty-seven miles an hour to the steam-engine's fifty. The result of all the other five races was the same—victory for electricity. In the second run the electric train reached a speed of 60 miles an hour to the steam train's 53.6, and in the third run 61.6 miles to 56 miles an hour. In the last two trials the electric locomotive was run at full speed; with one coach attached its maximum speed was 79 miles an hour, and without any coach over 80 miles an hour. Had not the precaution been taken of shutting off the power when rounding curves a speed of 90 miles an hour would probably have been reached. The net result of these runs seems to be a demonstration that, the conditions being equal, a lighter electric locomotive will haul a load of given weight at a higher speed and with greater powers of acceleration than a steam locomotive.

It is reported by Mr. S. P. Cockerell, commercial attaché to the British Embassy at Madrid, that, according to the Government returns, there were in Spain in 1901 only 861 electric power stations, of which 651 were restricted to

public lighting and 210 to private lighting. Since then the number of power stations for electric lighting has increased considerably, and it may be added also that the use of electricity in its multiple other applications has also increased and become more general (transmission and distribution of energy, electro-chemical industries, smelting furnaces, &c.); but there is still a vast field for further industrial developments, as the supply of power which the country affords is far yet from being exhausted. Indeed, while some regions of Spain appear to be almost over-developed, there are others which are completely abandoned. Most Spanish towns of any importance, Mr. Cockerell says, have a fair service of public and private electric lighting, but business in this direction is not by a long way yet exhausted, as many of the existing installations are deficient and could easily be reformed, or competition could easily be effected under favourable conditions, thanks to the improvements which the construction of electrical machinery and material have undergone during late years. And, furthermore, there are a considerable number of towns, some of them of importance, which are not yet supplied with electric lighting. Leaving on one side the question of competition, there is, as stated above, still much to be done by way of electric lighting for smaller towns and villages, and in Mr. Cockerell's opinion an investment in such undertakings would yield fair profits without going to great expense. There are in Spain in its various provinces over 400 towns and villages of over 4,000 inhabitants where there are no electric power stations. British capitalists should, says Mr. Cockerell, study care-

fully the advisability of installing electric light plants in the larger towns and even in the smaller ones, and quick action in the matter would, in his opinion, fully compensate such an undertaking. As regards the towns and villages which are not yet lighted by electricity, Mr. Cockerell states that the north-west region of Spain (Galicia) is almost devoid of electricity.

THE slate quarrying district of Easdale (Argyllshire) is at present the centre of serious dissatisfaction on the part of the workmen, which threatens to lead to a stoppage of the works there. There are four quarries in the district, all under one management, and the quarries on the island of Easdale, owned by the Easdale Slate Company. Of late the slate trade on the west coast has been unsatisfactory, and an effort is being made to group all these quarries under one management, to be in the hands of a new company to be formed in Glasgow. The system of working the quarries hitherto has been what is called the "crew" system—that is, each crew, or section of men, contract to excavate an allotted portion of the quarry, dividing the labour so that the crew is responsible for all the work in that portion to the completion of the finished slate. When the last pay was made, a new method of working the quarry was intimated, namely, that the quarries be divided into two classes, one to work as labourers in the quarry at 6d. per hour, and the other section on the bank at piecework, as before, and to be paid at the rate of 10s. per 1,000 slates dressed. The men unanimously reject these proposals, on the ground that the arrangement will be detrimental to the life of the quarries, inasmuch as it will lead to "picking the eyes" of the quarries, and that in a short time they would become useless, thereby depriving them in future years of all hope of employment. They unanimously adhere to the "crew" system, under which uninterrupted employment is always available, an advantage which they feel will be destroyed by the proposed system. They therefore intimated to the employers their absolute refusal of the system proposed, demanding the preservation of the "crew" system. On the part of the masters it is explained that they desire to give the new system a trial. Both sides are meantime uncompromising in their attitude, and the present prospects are that the quarries will be thrown idle for some time.

## SYRIAN ASPHALTE.

In his report the United States Consul-General, G. B. Ravndal, writing from Beirut, says:—

At the time of my 1905 report the only deposits exploited were those at the headwaters of the Jordan, the Hasbeya pits, the product of which is still sold to America and Europe for use in the manufacture of black varnish (for furniture, leather, &c.). The Hasbeya mines have been lying idle for several years, and it is old accumulated stock that is on the market.

In my report alluded to I recommended that efforts be made to obtain a concession from the "Liste Civile" at Constantinople for the further development and exploitation of the Hasbeya bitumen fields. Eventually the concession could no doubt be extended so as to include the Dead Sea and Latakia asphalte, and perhaps the phosphates of the Jordan Valley and other natural resources of Palestine, which, for industrial and commercial purposes, are as yet untouched, including the mineral waters and salts of the hot springs between Lake Tiberias and the Dead Sea.

My recommendation still holds good and stands for what it is worth, except that in the meantime an Anglo-Egyptian company has obtained from the Imperial Government a concession covering the Latakia Mountains. Asphaltic layers have been found near Kferie, a village about twenty-five miles north-east of the port of Latakia, along the road leading toward Aleppo, which have been declared by competent mining engineers to be not only rich in asphalte, but also practically inexhaustible. Application has been made by the company for the right to construct a light railway from the prospective mining district to the port of Latakia and also proper harbour facilities.

Some two months ago I had a conversation with an American who is now buying up asphalte-bearing lands in the southern districts of Palestine, in the region around Beer-Sheba and not far from the Egyptian boundary. I sincerely hope the enterprise will prove successful. American trade in Western Asia will be greatly encouraged and promoted by American investments of capital out here in public works, such as railways, electric street systems, telephone lines, tourist resorts, as well as in the development of natural resources which lie dormant.

## STRONG-ROOM FITTINGS.

In his "Almanac" for 1908 Mr. Puach refers with pride to the foresight of one of his artists, George Du Maurier, in representing an amateur, when he wished to give a delightful musical evening to his friends going to a treasury and taking from the shelves the compositions which one of the scientific instruments was to render. Anyone who wishes to emulate that amateur will find it to his advantage to examine the wrought-iron fittings which Messrs. Farrow & Jackson have prepared. Their names have long been known to all good people who feel a pride in the condition of their

wines; and they have extended their work by preparing strong-room fittings for banks, solicitors' offices, municipal offices, museums and public institutions where economy of space and safety are desirable. Their system is so adaptable that it would be difficult to say for what kind of storage it is not fitted. The material employed is the most secure which exists. If the position of the store-room is damp, by galvanising the light bars no decay from rust can arise.

## ARCHITECTS' TECHNICAL BUREAU.

THROUGH the courtesy of the editor, we are glad to have this opportunity of drawing the attention of the architectural profession to the establishment of the Architects' Technical Bureau.

We believe there are many among us who have for a long time felt the want of such an institution, and the reason is not far to be sought, when one glances at the immense growth and advancement that have taken place in building methods and materials during recent years. Simultaneously with this development is a proportionate increase in our responsibility and liability, and architects as a conscientious and professional body cannot afford to be without the ready means for acquiring disinterested information, which it is hoped to provide through the medium of this bureau. Architects are regarded by manufacturers as being too conservative, and one hears it on all sides that difficulty is encountered in bringing any innovation, however desirable and useful it may be, to the personal notice of architects. If manufacturers knew how inundated we are with circulars, trade lists, travellers and so forth, they would not be surprised at architects turning a deaf ear to their proposals. One remedy is to centralise all catalogues, pamphlets and circulars; have them carefully classified and tabulated, so that an architect when requiring any special information could obtain it from a central office. This the bureau proposes to do, and wherever practicable to make this information more useful by having tests and reports made by experts, these to be supported by the views of those architects who have had experience of the goods under examination. By this means we believe confidence will be readily established, and progress, at present so retarded, greatly assisted.

Apart from these reports, how deplorable is the waste of time incurred in searching through catalogues for some particular information that is required, and if eventually found is often out of date. Manufacturers cannot keep the catalogues they send us up to date, for cost of materials, &c., fluctuates, but a central office can be kept so.

It would, further, be most desirable, we are of opinion, to ascertain from some office where one could see in build-

ings erected the materials or fittings, as the case may be, that it is contemplated to use. It is the intention of the bureau, with the permission of the respective architects, to make records of the firms supplying the materials and fittings to the various prominent buildings throughout the country as erected, and also to give the architect's name, for many of us are quite prepared to repose confidence in the judgment of some architect known to us who had used the contemplated goods, and these records would also be a ready means for ascertaining what architects had utilised the various materials, &c.

We trust that architects generally will appreciate the idea that has resulted in the establishment of this bureau, for though at present we have over 500 architects as subscribers from all parts of the country, we hope as time goes on to greatly increase our numbers.

The bureau is to be under popular control, the committee being elected from the subscribers, and the strictest impartiality will be observed throughout.

## CUCKNEY CHURCH.

THE parish church of Norton Cuckney, near Welbeck Abbey, was reopened on Sunday. The church appears to have been rebuilt in the thirteenth century, the existing portions of this period being chiefly the tower and the porch. This thirteenth-century building is remarkable for

## No. 2 "SIGNET" Combined Range and Sitting-Room Grate.

Very suitable for Small Houses, Country Cottages, Flats, &c. (Patented).

Combines in itself in a practical and efficient manner the essential features of a Cooking Range and Sitting-room Grate.

ATTENTION is specially directed to the "Signet" Patent Combined Canopy and Damper with which all these Grates are fitted. It will be found to be of great use as a FUEL ECONOMISER by adjusting it so as just to permit of the smoke getting away, but no more, thus preventing the escape of warm air into the chimney, and giving the radiating power of the Grate its full value as a means of warming the apartment; also as a baffle against draughts, &c. IT IS THE ONLY GRATE OF ITS KIND POSSESSING THIS IMPORTANT FEATURE.

Has been THOROUGHLY TESTED and has given UNIVERSAL SATISFACTION. This Grate can only be supplied through Builders' Merchants, Ironmongers, &c. Copies of unsolicited testimonials and further particulars may be had from the Makers,

# CAMELON IRON CO., Ltd.,

## Falkirk, Scotland.

ESTABLISHED 1845.

LONDON OFFICE AND SHOWROOMS: 18 & 19 Queenhithe, Upper Thames Street, E.C.

No. 39 FALKIRK.  
No. 9105 CENTRAL, LONDON.

its great length, being one of the longest village churches in Nottinghamshire, the extreme length from east to west externally being 145 feet.

The recent restoration works were planned last year by Mr. Louis Ambler, architect, of London, and the cost has been mostly defrayed by the Duke of Portland, who is lay rector of the church and patron of the living.

The restoration is not complete, most of the proposed work to the chancel and north aisle still remaining to be done, also some of the work to the tower, but the following portions have been completed, enabling the church to be reopened. The ground on the west and south sides has been lowered to its original level, and the paths have been re-formed and the drainage entirely renewed. The bases and plinths of the porch and the plinth of the tower and nave are now disclosed, having been buried. The whole of the rough-cast has been removed from the walls, also the stucco from inside the porch, and the walls have been repaired and repointed, including the upper portion of the tower. Moulded stone cornices have been put to the nave walls, and the porch walls have been underpinned, the buttresses, bases and plinths repaired where now uncovered, and the gable raised and restored to its original pitch. Weldon stone has been used for the external masonry, the old Bolsover stone quoins being reused. The external steps down to the porch from outside have been removed, the ground being now below the floor level of the porch. New open timber roofs of a higher pitch have been substituted for the former low-pitched roofs over the nave and porch, and the south slopes have been covered with green Buttermere slates, the old slates being reused on the north side. The floors of the nave, north aisle and tower have been lowered to what is believed to have been their original levels, about 18 inches below the ground outside, disclosing the bases of the piers, which have been repaired and restored. The old Bolsover stone paving has been relaid in the passages, the nave passage being now made central, and the floors under the seats and in the tower (this space now forming a choir vestry) have been laid with wood-block flooring. The plaster has been stripped from the internal walls of the nave and the lower portion of the tower, and the walls have been repaired and pointed. The

thick layers of whitewash have also been carefully removed from the stone arches, piers and columnus, revealing traces of old painted decorations and enrichments of various patterns and designs, probably stencilled. These have been preserved, as far as possible, and the piers and arches have been repaired and restored.

The imitation panelling has been removed from the sanctuary, and the plastered walls of the chancel and north aisle have been repaired and distempered. New oak doors with ornamental iron hinges have been substituted for the dilapidated deal doors throughout. The vestry fittings and inner porch are of pitch pine. The old high-backed pews have been removed and new seating of pitch pine has been made at Welbeck for the nave, this and the vestry fittings and the whole of the roof timbers having been stained a quiet shade of brown and varnished.

#### THE MARBLE QUARRIES OF CARRARA.

Few, if any, industries in the world have a greater percentage of waste than marble quarrying as it is done in Italy, says Mr. Day Allen Willey, in the *Scientific American*, yet the famous Carrara deposits have been worked over 2,000 years, and according to the statements of experts who have examined the mountains of marble in this locality, the quality of high grade material yet to be excavated is so great that Carrara promises to supply the present rate of demand for its marbles for centuries to come.

When nature created this section of the Apuan Alps, she formed a storehouse of marble that is truly marvellous in extent, for beds of the finest quality of the Carrara grade are known to exist as high as 5,500 feet above the level of the sea. The exact depth is unknown, as the deposits have as yet not been thoroughly investigated by the use of machinery. Test borings which have been made, however, show that a considerable portion of the mountain formation in the commune of Massa, in which Carrara lies, seems to be entirely of marble, and it is believed that in places the formation extends fully 500 feet downward, with not even a layer or thrust of other stone. One reason why the extent of the resource has thus far been merely guessed at, so to

speak, is because so much of it is hidden by great masses of *débris*—the waste from workings that date back many centuries. The quarrymen of olden times opened the beds which were most convenient on the mountain slope, and much of the refuse fell into valleys. Some of these piles are hundreds of feet in thickness, and the labour of removing them would require so much time and expense, that it would not be profitable until the formation now so accessible has been taken out and the marble advances in price.

The grain of the marble quarried at the present time is said to be fully as fine as that secured a century ago, as is shown by comparing the blocks with the waste taken from the older workings. It still has a greater reputation among sculptors than the Pentelic, Hymetian, or even the finest Parian, both by reason of its grain and the fact that it can be fashioned with such ease into statuary and other forms. In recent years the quarries of Carrara have had an annual aggregate output of about 200,000 tons. They supply the bulk of the marble used in Italy and Europe to-day for sculpture and other ornamental work, while, as is well known, a large amount is sent to the United States in blocks in the rough or in the finished form.

These deposits are quite accessible, especially since the principal workings are now reached by a railway which connects them with the principal shipping point—the little seaport of Avenza on the Gulf of Liguria. Avenza is really only three miles from the town of Carrara itself, but the quarries are distributed over an area which extends several miles beyond its borders. The nearest large city is Pisa in North Italy, 32 miles distant. Most of the marble at it comes from the quarries to Avenza, is placed on sailing vessels and small steamers and carried to Genoa and Leghorn, where there are extensive marble works. These cities are also the principal places for shipping it to other parts of Europe as well as America. At the present time about six hundred quarries in all are in actual operation. Of these, more than half are in Carrara or its vicinity, about fifty are in the city of Massa, and the rest scattered principally in the commune of Massa. They give employment to about 6,000 men and boys, and are the sole support of a population of nearly 75,000 in this part of Italy.

As in other old industries, tedious and wasteful methods are still employed extensively at Carrara. Although steam

and electric-driven machinery for stone-cutting has been invented for a period of years, the Italians continue to use hand drills extensively, and employ explosives freely in getting out the material, so that the visitor familiar with the system in America regards their antiquated ways with surprise. In the Vermont quarries, for example, most of the blocks of all sizes are secured by channelling entirely with power tools. Where these cannot be placed in service, pneumatic and electric-driven drills are substituted. The channeller travels back and forth on a track which is pinned to the solid rock, making a ridge or channel which averages one and one-fourth inches in width and ranges from four to ten feet in depth. This incision is made parallel with the rails of the channeller track, but a few inches to one side. The machine cuts but one channel at a time, and in its operation is somewhat similar to the ordinary steam drill, with this exception, that the rotary motion is avoided. In order to cut the channel evenly, no less than five drills are assembled, each having a separate bit.

Another type of cutting machine is operated either by steam or electric power as desired. It is also moved back and forth on a track, but makes a channel on each side of the track and parallel with it. In this apparatus the drills are also arranged in clamps in groups of five, the up-and-down stroke of the drills where operated by steam being obtained through a double system of levers connected with a crank-pin on the crank-shaft of the engine. Between the levers is a system of springs, also between the lower lever and the frame, and the motion of the machine along the track is secured by connecting the crank-shaft of the engine with the trucks through a system of gears. With this type of channeller there is a constant relation between the speed of the machine and the strokes of the drill. When electricity is used in place of steam-power, a connection is made between the electric motor and the shaft by means of bevel gears.

The use of this labour-saving mechanism is one reason why the American quarries can be operated at a profit, although most of the marble has to be lifted to heights ranging from 50 to 300 feet from the beds, necessitating the installation of powerful boom derricks and hoisting cranes. The Italians have one great advantage owing to the elevation of so many of their quarries. As already

stated, beds exist in the Apuan Alps at an altitude of 5,500 feet, while many of the workings are more than 2,000 feet above the sea. Therefore much of the expense of derrick machinery is avoided, and the force of gravity is an economical factor that partly makes up for the enormous waste incurred by the methods of quarrying. While some of the lessees have installed drills actuated by steam and electric-power, such are only occasional instances, much of the drilling being done with the hand-power ratchet type of drill. Neither the channeller nor any other apparatus for grooving the marble has yet been employed except in a few works, the bulk of the product being obtained by blowing it out. The holes are drilled where in the judgment of the quarry director the explosion will be most effective, but before being charged they are usually enlarged by pouring nitric acid into them which eats away the interior. The explosive, which is usually blasting powder, is then inserted. In recent years the electric current has been introduced to ignite it, but in many of the larger operations the fuse is still employed.

The charges are not always so distributed that the block desired is loosened, so a second blast is frequently necessary to completely detach the mass, when some of the needless surface is cut off on the spot with chisel and mallet. Then the material is ready to be transported to the marble mills in the valley or to Avenza for shipment by water. As the quarry may be several miles from the railroad, advantage is taken of its elevation. If it is a very large piece, an inclined plane may be made, down which the block slides upon a wooden sledge, controlled by ropes fastened about it, which are run through pulleys, so that the speed can be regulated. At the foot of the incline it is jacked up on a clumsy but strong cart drawn by oxen. Sometimes a string of twenty or more of these beasts are hitched to the cart by means of wooden yokes of the pattern used a hundred or more years ago. Thus it is transported to the railroad or mill.

To save the expense of transporting refuse material, a considerable amount of the marble is sawed and finished at Carrara, but here again most of the work is performed by antiquated machinery. Plants where the slabs are actually sawed by hand are numerous. A crude frame somewhat resembling the old-fashioned American bucksaw, but much

larger, holds the saw blade, which is usually of steel and when new is about 5 inches in width. This is pulled back and forth across the surface of the stone by two men, one at each end of it. Water flows along the cut from a wooden trough resting on one end of the block, and thus the metal is cooled. The work is so slow, however, that a groove 4 inches deep is considered a fair day's work, for which each man receives the equivalent of about 35 cents in American money. Recently several mills have been established containing gangs of saws moved by water-power, as in Vermont, but they cut only a small portion of the marble. Power is used more extensively for operating the finishing tables, where the slabs are smoothed and polished while rotating beneath pumice and wooden polishing blocks, although some of this labour is still performed by hand.

Strange as it may seem, the Carrara deposits are not absolutely owned by any private individuals or companies. Since the era of the Roman republic, they have been what is termed State property in Italy. At one time they were under the control of the Bishop of Luni, the chief Roman city which was located in this portion of Italy, being ceded to the bishop in 1183. This will give an idea of the long time during which the quarries have been in operation. The present method of working them is for a person to lease a certain portion. The price paid the State for this lease, however, is so small that it is but nominal, and the lessee practically secures the revenue from the industry without any expense except that incurred for the wages of the labourers, the cost and care of the draft animals and the machinery which he may install. These are reasons why the processes followed are still so antiquated in comparison with quarrying in other parts of the world.

The different kinds of marble are not arranged in layers, but blend with one another like the colours of the rainbow. A little sandy coating covers the blocks and divides each from the other. It is noticed that where marble is exposed to the sun, it becomes harder; where it is placed in the shade, it becomes finer and softer. From an admixture of metallic substances, the marbles are sometimes marked, speckled, veined and spotted. Though the marbles are of great variety, they may all be reduced to three classifications of *brecciatì*, *bardigli*, and *bianchi*. Although

the elegant *brecciato* is much liked for ornaments, and the flowered *bardiglio* is useful, still it is the *bianco* which is of the greatest importance, and the white statuary marble is the noblest of all. It has many varieties. Sometimes it is of dazzling whiteness, sometimes it inclines to blue, sometimes to flesh colour, as is the case with *crestola*, which is by far the most beautiful. It rises in value in proportion to its freshness, its tint, its crystallisation and the size of the piece. Its freedom from impurities is also a matter of much consideration. The *crestola* is the choicest of all, either on account of the beauty of its surface or because, from being less liable to chip, it can receive from an expert hand more finely chiselled and delicate features. A beautiful proof of the excellence of this marble was given by the sculptor Moli in his "Pompeian Mother." The woman, flying with her child from the disaster, tries to shield herself from the burning rain with some drapery or a sheet, which she holds high above her head. The air which she displaces in running swells the folds of the drapery, which, owing to the masterly way in which these folds are executed, and the delicacy of the work, is so fragile, that it seems as thin and transparent as if it were linen. The most colossal monuments, however, the loftiest columns and the most sumptuous vestibules are made of *bianco-chiaro*.

Nearly one hundred and fifty years ago the famous Academy of Fine Arts was established at Carrara; but as far back as the fifteenth century these marble mountains attracted the sculptor, and the little city has long been one of the actual art centres of Europe, though seldom heard of compared with Florence and other Italian communities. Michel Angelo worked here for years, and was one of the first savants to realise the extent and quality of the beds. Bandinella and many other masters of the chisel had studios in Carrara, and some of their creations are to be seen in the museum, which contains one of the most valuable collections of sculpture in existence, including pieces which date back nearly to the era of the Roman republic. Carrara has also been a great school for sculptors. It has been said that even the quarrymen inherit a talent for fashioning with the chisel, handed down through generations. Certain it is that a large number have become expert with the use of this tool.

### REINFORCED CONCRETE REGULATIONS.

The following regulations of the Bureau of Building Inspection of Philadelphia, in regard to the use of reinforced concrete, have been approved by the Director of the Department of Public Safety:—

The term "reinforced concrete" shall be understood to mean an approved concrete mixture reinforced by steel or iron of any shape, so that the steel or iron will take up all the tensional stresses and assist in the resistance to compression and shear.

Before a permit to erect any reinforced concrete structure is issued, complete specifications and drawings shall be filed with the Bureau of Building Inspection, showing all details of the construction, size and position of all reinforcing rods, stirrups, &c., and giving the composition and proportions of the concrete.

The execution of the work shall be performed by workmen under the direct supervision of a competent foreman or superintendent.

Reinforced concrete construction will be accepted for fireproof buildings of the first class if designed as herein-after prescribed; provided that the aggregate for such concrete shall be clean, broken, hard stone, or clean graded gravel, together with clean siliceous sand or fine grained gravel; should the concrete be used for flooring between rolled steel beams, clean furnace clinkers entirely free of combustible matter, or suitable seasoned furnace slag may be used; when stone is used with sand gravel it must be of a size to pass through a 1-inch ring, and 25 per cent. of the whole must not be more than one-half the maximum size; and provided further, that the minimum thickness of concrete surrounding the reinforcing members of reinforced concrete beams and girders shall be 2 inches on the bottom and 1½ inches on the sides of the said beams and girders. The minimum thickness of concrete under slab rods shall be 1 inch. All reinforcement in columns to have a minimum protection of 2 inches of concrete.

All the requirements herein specified for the protection of steel and for fire-resisting purposes shall apply to reinforced concrete flooring between rolled-steel beams as well as to reinforced concrete beams and to entire structures in reinforced concrete. Any concrete structure or the floor

York Mansion, York Street, Westminster, S.W.

filling in same, reinforced or otherwise, which may be erected on a permanent centring of sheet metal, of metal lathing and curved bars or a metal centring of any other form, must be strong enough to carry its load without assistance from the centring, unless the concrete is so applied as to protect the centring as herein specified for metal reinforcement.

Exposed metal centring or exposed metal of any kind will not be considered a factor in the strength of any part of any concrete structure, and a plaster finish applied over the metal shall not be deemed sufficient protection unless applied of sufficient thickness and properly secured, as approved by the Chief of the Bureau of Building Inspection.

All concrete shall be mixed in a mechanical batch mixer to be approved by the Bureau of Building Inspection, except when limited quantities are required or when the condition of the work makes hand mixing preferable; hand mixing to be done only when approved by the Bureau of Building Inspection. In all mixing the material shall be measured for each batch.

When hand mixing is done under the aforesaid limitations, the cement and fine gravel or coarse sand shall be first thoroughly mixed dry and then made into a mortar by gradually adding the proper amount of water. The crushed stone or gravel shall be spread out to a depth not to exceed 6 inches, in a tight box or upon a proper floor, and be sprinkled with water as directed; the mortar is then to be evenly spread over the crushed stone, and the whole mass turned over a sufficient number of times to effect the thorough mixing of the ingredients.

All forms and centring for concrete shall be built plumb and in a substantial manner, made tight so that no part of the concrete mixture will leak out through cracks or holes or joints, and after completion shall be thoroughly cleaned, removing shavings, chips, pieces of wood and other material; and no debris of any kind shall be permitted to remain in the forms. All forms to be properly supported and braced in a manner to safely sustain the dead load and the load that may be imposed upon them during construction.

The reinforcing steel shall be accurately located in the forms and secured against displacement.

Concrete shall be placed immediately after mixing.

Whenever fresh concrete joins concrete that is set, or

partially set, the surface of the old concrete shall be roughened, cleaned and spread with cement mortar, which mortar shall be mixed in proportions of one of cement to two of sand.

Concrete shall not be mixed or deposited in freezing weather, unless precautions are taken to avoid the use of material covered with ice or snow or that are in any other way unfit for use, and that further precautions are taken to prevent the concrete from freezing after being put in place. All forms under concrete so placed to remain until all evidences of frost are absent from the concrete, and the natural hardening of the concrete has proceeded to the point of safety.

Concrete laid during hot weather shall be drenched with water twice daily, Sunday included, during the first week. The broken stone, if hot and dry, must be wet before going to the mixer.

The time at which props or shores may safely be removed from under floors and roofs will vary with the condition of the weather, but in no case should they be removed in less than two weeks; provided that column forms shall not be removed in less than four days; provided further, that the centring from the bottom of slabs and sides of beams and girders may be removed after the concrete has set one week, provided that the floor has obtained sufficient hardness to sustain the dead weight of the said floor and that no load or weight shall be placed on any portion of the construction where the said centres have been removed.

The concrete for all girders, beams, slabs and columns shall be mixed in the proportions of one of cement, two of sand or fine gravel, and four of other aggregates as before provided. The concrete used in reinforced concrete-steel construction must be what is usually known as a "wet" mixture. When the concrete is placed in water it must be placed in a semi-dry state.

Only Portland cement shall be permitted in reinforced concrete constructed buildings. All cement shall be tested, in carload lots when so delivered or in quantities equal to same, and report filed with the Bureau of Building Inspection before using it in the work. Cement failing to meet the requirements of the accelerated test will be rejected.

*Soundness, Accelerated Test.*—Pats of neat cement will be allowed to harden 24 hours in moist air, and then be submitted to the accelerated test as follows:—A pat is ex-

posed in any convenient way in an atmosphere of steam, above boiling water, in a loosely closed vessel, for 3 hours, after which, before the pat cools, it is placed in the boiling water for 5 additional hours.

To pass the accelerated test satisfactorily, the pats shall remain firm and hard, and show no signs of cracking, distortion or disintegration.

Such cements, when tested, shall have a minimum tensile strength as follows:—Neat cement shall, after one day in moist air, develop a tensile strength of at least 150 lbs. per square inch; and after one day in air and six days in water shall develop a tensile strength of at least 500 lbs. per square inch; and after one day in air and 27 days in water shall develop a tensile strength of at least 600 lbs. per square inch. Cement and sand tests composed of one part of cement and three parts of crushed quartz shall, after one day in air and six days in water, develop a tensile strength of at least 175 lbs. per square inch; and after one day in air and 27 days in water shall develop a tensile strength of at least 240 lbs. per square inch. These and other tests as to fineness, set, &c., made in accordance with the standard method prescribed by the American Society of Civil Engineers, may from time to time be required by the Bureau of Building Inspection.

**Walls.**—Reinforced concrete may be used in place of brick and stone walls, in which cases the thickness may be two-thirds of that required for brick walls as shown in the Schedule, Section 18 of the Act of Assembly, No. 123 of the Commonwealth of Pennsylvania, approved June 5, 1901, provided the unit stresses as set forth in these regulations are not exceeded.

Concrete walls in such cases must be reinforced in both directions in a manner to meet the approval of the Chief of the Bureau of Building Inspection.

**Steel.**—All reinforcements used in reinforced concrete shall be of standard grade of structural steel or iron of either grade to meet the "Manufacturers' Standard Specifications," revised February 3, 1903.

Reinforced concrete slabs, beams and girders shall be designed in accordance with the following assumptions and requirements:—

(a) The common theory of flexure to be applied to all beams and members resisting bending.

(b) The adhesion between the concrete and the steel is sufficient to make the two materials act together.

(c) The design shall be based on the assumption of a load four times as great as the total load (ordinary dead load plus ordinary live load).

(d) The steel to take all the tensile stresses.

(e) The stress-strain curve of concrete in compression is a straight line.

(f) The ratio of the moduli of elasticity of concrete to steel:—

Stone or gravel concrete . . . . .	1 to 12
Slag concrete . . . . .	1 to 15
Cinder concrete . . . . .	1 to 30

The allowable unit transverse stress upon concrete in compression:—

Stone or gravel concrete . . . . .	600 lbs. per sq. in.
Slag concrete . . . . .	400 " "
Cinder concrete . . . . .	250 " "

The allowable unit transverse stress in tension:—

Iron . . . . .	12,000 lbs. per sq. in.
Steel . . . . .	16,000 " "

The allowable unit shearing strength upon concrete:—

Stone or gravel concrete . . . . .	75 lbs. per sq. in.
Slag concrete . . . . .	50 " "
Cinder concrete . . . . .	25 " "

The allowable unit adhesive strength of concrete:—

Stone or gravel concrete . . . . .	50 lbs. per sq. in.
Slag concrete . . . . .	40 " "
Cinder concrete . . . . .	15 " "

The allowable unit stresses upon concrete in direct compression in columns:—

Stone or gravel concrete . . . . .	500 lbs. per sq. in.
Slag concrete . . . . .	300 " "
Cinder concrete . . . . .	150 " "

The allowable unit stress upon hoop columns composed of stone or gravel concrete shall not be over 1,000 lbs. per square inch, figuring the net area of the circle within the hooping. The percentage of longitudinal rods and the spacing of the hoops to be such as to permit the concrete to safely develop the above unit stress with a factor of safety of four.

# McDOWALL, STEVEN & CO., LTD.

4

Thames  
Street,  
LONDON,  
E.C.

Engineers,

Ironfounders.

4  
Upper  
Thames  
Street,  
LONDON,  
E.C.

Manufacturers of the "12-hours" Boiler, and  
Heating Apparatus of all descriptions. —

When steel or iron is in the compression sides of beams the proportion of stress taken by the steel or iron shall be in the ratio of the modulus of elasticity of the steel or iron to the modulus of elasticity of the concrete, provided that the rods are well tied with stirrups connecting with the lower rods of the beams; provided further, that when rods are used in compression, the approval of the Chief of the Bureau of Building Inspection must be obtained.

In the design of structures involving reinforced concrete beams and girders, as well as slabs, the beams and girders shall be treated as T-beams, with a portion of the slab acting as flange in each case. The portion of the slab that may be used to take compression shall be dependent upon the horizontal shearing stress that may exist in the beam, and in no case shall the slab portion exceed twenty times the thickness of the slab.

All reinforced concrete T-beams must be reinforced against the shearing stress along the plane of junction of the rib and the flange, using stirrups throughout the length of the beam. Where reinforced concrete girders carry reinforced concrete beams, the portion of the floor slab acting as flange to the girder must be reinforced with bars near the top, at right angles to the girder, to enable it to transmit local loads directly to the girder and not through the beams, thus avoiding an integration of compressive stresses due to simultaneous action as floor slab and girder flange.

In the execution of work in the field, work must be so carried on that the ribs of all girders and beams shall be monolithic with the floor slabs.

In all reinforced concrete structures special care must be taken with the design of joints to provide against local stresses and secondary stresses due to the continuity of the structures.

Shrinkage and thermal stresses shall be provided for by the introduction of steel.

In the determination of bending moments due to the external forces, beams and girders shall be considered as simply supported at the ends, no allowance being made for continuous construction over supports. Floor slabs, when constructed continuously, and when provided with reinforcement at top of slab over the supports, may be treated as continuous beams, the bending moment for uniformly

distributed loads being taken at not less than  $WL/10$ . In cases of square floor slabs which are reinforced in both directions and supported on all sides, the bending moment may be taken at  $WL/20$ ; provided that in floor slabs in juxtaposition to the walls of the building the bending moment shall be considered as  $WL/8$ , when reinforced in one direction, and if the floor slab is square and reinforced in both directions, the bending moment shall be taken as  $WL/16$ .

When the shearing stresses developed in any part of a reinforced concrete building exceed under the multiplied loads the shearing strength as fixed in this section, a sufficient amount of steel shall be introduced in such a position that the deficiency in the resistance to shear is overcome.

When the safe limit of adhesion between the concrete and steel is exceeded, provision must be made for transmitting the strength of the steel to the concrete.

Reinforced concrete may be used for columns in which the ratio of the length to least side or diameter does not exceed fifteen. If more than fifteen diameters the allowable stress shall be decreased proportionately. Reinforcing rods that are introduced for lateral stresses must be tied together at intervals of not more than the least side or diameter of the columns.

Longitudinal reinforcing rods will not be considered as taking any direct compression.

The contractor must be prepared to make load tests in any portion of a reinforced concrete building within a reasonable time after erection, and as soon as may be required by the Chief of the Bureau of Building Inspection. The tests must show that the construction will sustain a load equal to twice the calculated live load without signs of cracks.

Systems of construction differing from the standard already approved and tested may be required to pass a load, fire and water test, as present in Section 2 of the Act of Assembly, No. 236 of the Commonwealth of Pennsylvania, approved April 25, 1903.

The Chief of the Bureau of Building Inspection may from time to time issue such modifications to these regulations as may be found necessary to conform to modern practice.

FLOORING SYNDICATE, LIMITED,  
133-136 High Holborn, London, W.C.

Telegrams: "Soundproof."  
Telephone: 3098 Gerrard.

## BEXHILL PATENT CASEMENT

### CONSTRUCTION.

The Casements are hinged together at the centre. The ends pivoted in metal shoes, which slide on runner blocks along the channel guides in head and sill. The lower channel guide is fitted with a rack (raised and lowered by the centre lever handle), which engages with corresponding teeth in the lower runner block, thus enabling the casements to be securely locked in any position along the whole length of the frame.

The locking arrangement is extremely simple, and cannot get out of order.

### ADVANTAGES.

Perfectly weather and draught proof.  
Cannot rattle, even in the highest wind.  
No cords or weights, and no bolts, locks, etc., as other patent windows.  
When fully open the whole area of opening is exposed.  
Can be set at any angle against the wind.  
Each wing acts as a stay to the other so that they cannot possibly be blown from the hinges.  
Both wings are simultaneously locked in any position.  
Night ventilation obtained by slightly opening the casement so that the sides still rest against the frame. Fresh air will be obtained from below, and foul air drawn out at the top.

THE EXTERNAL SURFACE OF THE GLASS IS ACCESSIBLE FOR CLEANING PURPOSES WHEN THE WINDOW IS IN ITS ORDINARY OPEN POSITION.

**CAMPBELL, SMITH, & CO., Ltd., Decorators, &c.**

1, 2 & 3 TRINITY PLACE, TOWER HILL, E.C.

Thirty-fourth Year of Publication. Now Ready.

**"THE ARCHITECT'S DIARY" for 1908.**

Specially prepared for the use of **ARCHITECTS, SURVEYORS, and ENGINEERS.**

These Publications contain not only the usual Diary, ruled and printed to a particular form, specially adapted for professional use, but, in addition, an Index, a Note-Book, a Rent and Insurance Register, a Cash Book, and a Ledger, with all the usual diary information, and much special matter referring to the various Architects' and Engineers' Associations; a digest of all the Acts passed last Session; contain also cases decided in the Superior Courts of Justice during the legal year, from November 1906 to August 1907, of interest to the Profession; Regulations of the London County Council under the orders of the Council applying to Music, Dancing, Theatre, and other Licenses; complete List of Metropolitan Surveyors and Districts, with Official and Private Address; Alphabetical Index to the Practical Statutes, Stamp Duties, &c., the whole forming in **ONE VOLUME A COMPLETE SET OF BOOKS FOR THE YEAR.** The Editions are—  
No. 12.—One page to a day, size 8½ in. by 5 in., cloth, gilt, 4/6. | No. 13.—Two pages a day, size 8½ in. by 5 in., cloth, gilt, 5/6.

**"THE BUILDER'S DIARY" for 1908.**

Specially prepared for the use of **BUILDERS and CONTRACTORS.**

No. 11.—Two days on a page, ruled and printed to a special pattern; also contains Bill Register, Note Book, Rent, Insurance, and Mortgage Register, Cash Book, Ledger and 130 pages of Tables of great value to all engaged in the Building Trade, in all 460 pages, size 8½ by 5, bound, whole cloth, gilt. Indexed, and paged to end of Diary. Price 4s. 6d.

"For use in the office of Architects and Builders they are better fitted than any diaries with which we are acquainted."—*The Architect.*

"The novel and valuable feature of these Diaries is that each volume forms in itself a complete set of books for the year."—*The Builder.*

"We have used them ourselves throughout the year with much satisfaction, and are glad now to draw attention to the new batch sent us."—*The Building News.*

"Messrs. Hudson & Kearns's Diaries need no recommendation save a trial."—*The British Architect.*

"The Diaries published by Messrs. Hudson & Kearns are quite unrivalled for convenience and comprehensiveness."—*Building World.*

"These Diaries may be said to have become the Diaries for the professions for which they are issued."—*Illustrated Carpenter and Builder.*

## PUBLIC NOTICE.

CORPORATION OF LONDON.  
PUBLIC HEALTH DEPARTMENT.  
Notice to Architects, Builders and Others.

**THE attention of Architects, Builders and other persons connected with building operations in the City, which are likely to involve the disturbance of human remains, is directed to the responsibilities incurred by any breach of the following Section of the Burial Act of 1857, and to the importance of at once giving notice to the Medical Officer of Health of any cases where human remains are discovered.**

BURIAL ACT, 1857, Section 25.

"Except in the cases where a body is removed from one consecrated place of burial to another by faculty granted by the ordinary for that purpose, it shall not be lawful to remove any body, or the remains of any body, which may have been interred in any place of burial, without license under the hand of one of Her Majesty's principal Secretaries of State, and with such precautions as such Secretary of State may prescribe as the condition of such license; and any person who shall remove any such body or remains, contrary to this enactment, or who shall neglect to observe the precautions prescribed as the condition of the license for removal, shall, on summary conviction before any two justices of the peace, forfeit and pay for every such offence a sum not exceeding ten pounds."

BELL.

Guildhall, E.C.: December 16, 1907.

## TENDERS.

COUNTY COUNCIL OF SALOP.  
Higher Education Department.

**TENDERS are invited for the Erection of a Secondary School at Bridgnorth to accommodate 200 pupils.**

Plans and specifications may be seen, and forms of tender and bills of quantities obtained, at the offices of Messrs. Pritchard & Pritchard, Architects, Kidderminster, on and after December 12, on payment of One Guinea, which will be returned on receipt of a bona-fide tender.

The lowest or any tender will not necessarily be accepted. Sealed tenders, endorsed "Bridgnorth Grammar School," are to be delivered to me, the undersigned, not later than December 31, 1907, at 5 o'clock p.m.

W. H. PENDLEBURY,

Secretary for Higher Education.  
St. John's Hill, Shrewsbury:  
November 25, 1907.

PARISH OF LAMBETH.—BOARD OF GUARDIANS.  
Drainage Works at Norwood Relief Station.

**THE Guardians of the Poor of the Parish of Lambeth hereby invite TENDERS for the reconstruction of the drainage system at their Relief Station, Elder Road, West Norwood, S.E.**

Tenders, which must be in the undermentioned form, superscribed "Tender for Drainage, Norwood Relief Station," must be sent to the Clerk to the Guardians before Ten o'clock on Wednesday morning, January 1 next, and will be opened at the Board Room at Noon on the same day.

Drawings and draft contract may be inspected at these offices on any day between the hours of 10 and 5.

Specification and form of tender will be supplied on personal application to the undersigned and on payment of £2 in respect thereof, which will be returned to each person sending a bona-fide tender, and copies of the drawing can also be obtained from the Clerk to the Guardians on further payment of the sum of Two Shillings per copy.

The Guardians do not pledge themselves to accept the lowest or any tender.

By Order of the Guardians,

W. THURNALL, Clerk.  
Guardians' Board Room and Offices,  
Brook Street, Kennington Road, S.E.:  
December 11, 1907.

HUDDERSFIELD CORPORATION WATERWORKS.  
Deerhill Catchwater and other Works.  
Contract No. 1.

**THE Corporation of Huddersfield are prepared to receive TENDERS from contractors experienced in the construction of waterworks for the construction of a Catchwater, about three miles in length; a Road, about a quarter of a mile long; and a Siphon over the embankment of the Butterley Reservoir, the Gull Brook, the Wessenden Valley, reached from the Marsden station on the London and North-Western Railway, between Manchester and Huddersfield; and for the construction of a Filter-house, &c., for the Longwood Reservoirs of the Corporation, reached from the Longwood Station on the same railway. The drawings may be seen and specification, schedule of quantities, and form of tender obtained at the offices of the engineers, Messrs. G. H. Hill & Sons, 3 Victoria Street, Westminster, and Albert Chambers, Albert Square, Manchester, on and after Wednesday, December 11, upon payment of the sum of £10. This sum will, after the Corporation shall have come to a decision on the tenders, and not before, be returned to the tenderer, provided that he shall have sent in a bona-fide tender, and shall not have withdrawn the same, and shall have returned the documents and drawings lent to him for the purpose of making up his tender. A limited number of sets of the drawings, uncoloured, are available, and will be lent to persons tendering in priority of application on receipt of the sum of two pounds (in addition to the aforesaid ten pounds), which sum of two pounds will not be returned. A representative of the engineers will point out the position of the intended works on Wednesday, December 18. He will start from Marsden Station on the arrival of the train from Huddersfield at 10.37 A.M. Persons who have applied for and received the specification, &c., and intend visiting the sites at that time, are recommended to arrange as to carriages with Mr. Albert Schofield, cab proprietor, Marsden, near Huddersfield.**

Sealed tenders, endorsed "Tender for Deerhill Catchwater and other Works," must be addressed to the Chairman of the Waterworks Committee, and received by me at the Town Hall, Huddersfield, on or before Wednesday, January 8, 1908. The Corporation do not bind themselves to accept the lowest or any tender.

By Order.

J. HENRY FIELD, Town Clerk.  
Town Hall, Huddersfield: December 6, 1907.

TO BUILDERS.

**THE St. Helens County Borough Council invite TENDERS for the Erection of new Schools in St. Helens.**

On deposit of One Guinea, which will be returned upon receipt of a bona-fide tender, plans and specifications may be inspected, and bills of quantities and conditions obtained at the office of the Architect, Mr. Frank S. Biram, Hardshaw Street, St. Helens, on and after Monday, December 23, 1907.

Sealed tenders, endorsed "Tenders for New Schools, Sutton," must be delivered to the undersigned not later than 10 A.M. on Saturday, January 25, 1908.

W. H. ANDREW, Town Clerk.

Town Hall, St. Helens:  
December 12, 1907.

## TENDERS.

COUNTY COUNCIL OF DURHAM.

New Council Schools at Blaydon and Chester-le-Street, and South Hetton.

**SOLE TENDERS are invited for the Erection of the above Schools.**

Plans, specifications and general conditions of contract can be seen, and bills of quantities obtained as follows:—  
For Blaydon School.—At the Office of Mr. J. Morson, architect, 77 Westgate Road, Newcastle-on-Tyne.

For Chester-le-Street School.—At the Office of Mr. W. H. Knowles, architect, 25 Collingwood Street, Newcastle-on-Tyne.  
For South Hetton.—At the Office of Mr. F. Renoldson, architect, 37 King Street, South Shields.

Sealed tenders, endorsed "Blaydon (or Chester-le-Street, or South Hetton), New School Tender," are to be sent to the undersigned on or before Tuesday, January 7, 1908.

The Council do not bind themselves to accept the lowest or any tender.

A. J. DAWSON.

Clerk to the Education Committee.  
Shire Hall, Durham: December 13, 1907.

TO BUILDERS AND CONTRACTORS.

**THE Metropolitan Asylums Board invite TENDERS for the Erection of new Coal Store at the Brook Fever Hospital, Shooter's Hill, Woolwich, S.E., in accordance with drawing and specification prepared by Mr. W. T. Hatch, M.Inst.C.E., M.I.Mech.E., engineer-in-chief.**

The drawing, conditions of contract, specification and form of tender may be inspected at the Office of the Board, Embankment, London, E.C., on and after Ten A.M. on Monday, December 23, and can then be obtained upon payment of a deposit of £1.

The amount of the deposit will be returned only to persons who have sent in bona-fide tenders and returned the drawings and specification in accordance with the instructions.

Tenders, addressed as noted on the form, must be delivered at the Office of the Board not later than Ten A.M. on Wednesday, January 8, 1908.

By Order.

T. DUNCOMBE-MANN,  
Clerk to the Board.  
December 16, 1907.

WEST RIDING COUNTY COUNCIL.

To Builders, Joiners, Slaters, Plumbers, Plasterers, Painters.

**THE West Riding Education Committee is prepared to receive whole or separate TENDERS for the Erection of a New Infants' School at Timbury.**

Plans may be seen and bills of quantities obtained on application to this office.

A deposit of £1 is required, which will be returned on receipt of a bona-fide tender. Cheques, &c., must be made payable to the West Riding treasurer and sent to him direct at the County Hall, Wakefield, otherwise applications will not be entertained.

Sealed tenders, properly endorsed, to be forwarded to the undersigned not later than 10.30 on the morning of January 10, 1908. All tenders received after this date will be returned.

J. VICKERS-EDWARDS,  
County Hall, Wakefield: County Architect.  
December 18, 1907.

LANCASHIRE EDUCATION COMMITTEE.

To Contractors.

**THE Lancashire Education Committee are prepared to receive TENDERS for the Erection of a new Public Elementary School and Technical Instruction Block at Great Harwood, near Blackburn, to accommodate 900 scholars.**

The plans may be seen and bills of quantities obtained at the office of the County Architect, Mr. Henry Little, 16 Ribblesdale Place, Preston, on payment of a deposit of £2, which will be returned upon receipt of a bona-fide tender.

The Committee do not bind themselves to accept the lowest or any tender.

Tenders must be delivered before Twelve o'clock Noon on Tuesday, January 7, 1908, sealed and endorsed, to Mr. W. Sagar, White House, Rishton, near Blackburn.

(Signed) HARCOURT E. CLARE,  
Clerk to the Lancashire County Council.  
County Offices, Preston: December 1907.

**THE Managers of Brisley Church of England Schools invite TENDERS for the Improvement and Enlargement of the Buildings.**

Plans and specifications may be seen at the schools on any day, and at any hour when the schools are open for instruction. The work will not be begun before April.

Tenders, fixing a date by which the work will be completed, must be sent to the Rev. W. H. Lowe, Brisley Rectory, East Dereham, on or before Saturday, December 23.

The advertisers do not bind themselves to accept the lowest or any tender.

NORTH-EASTERN RAILWAY.

To Builders.

**THE Directors are prepared to receive TENDERS for erecting Shops and Offices in Victoria Square, Hull.**

Plans and specification may be seen and quantities and further information obtained on application to Mr. W. H. Bell, the Company's Architect, at York, on and after Wednesday, the 17th inst.

Duplicate plans and specification may also be seen on application to the Station Master at Paragon Station, Hull.

Quantities supplied on personal application to parties tendering for the whole of the works.

Sealed tenders, marked "Shops, &c., Hull," to be sent to the Secretary at York not later than 9 A.M. on Wednesday, January 8, 1908.

The Directors do not bind themselves to accept the lowest or any tender.

R. F. DUNNELL, Secretary.  
York: December 16, 1907.

BILSTON URBAN DISTRICT COUNCIL.

Education Committee.

New Schools, Bullholes, Bilston.

To Builders and Contractors.

**THE Bilston Education Committee are prepared to receive TENDERS for the Erection of New Schools at Bullholes, Bilston, consisting of Boys, Girls, Infants and Senior Boys and Girls' Departments, for a total number of 1,350 Children, with Out-Offices and Boundary Walling in accordance with plans and specification prepared by Messrs. Bailey & McConnell, Architects, Bridge Street, Wallasey, at whose offices and also at the offices of the undersigned plans may be seen. Bills of quantities may be obtained from the Architects on payment of a deposit of One Guinea, which will be returned on receipt of a bona-fide tender.**

Tenders, sealed and endorsed "Tender for Bullholes Schools," must be sent to the undersigned not later than Twelve o'clock Midday on Saturday, January 18, 1908.

No pledge is given to accept the lowest or any tender, and no tender will be considered from any person who does not bind himself to pay the standard rate of wages current in the district to workmen engaged on the works.

FRED. M. COOPER,

Secretary.  
Education Offices, Town Hall, Bilston  
December 16, 1907.

## TENDERS.

CITY OF BIRMINGHAM EDUCATION COMMITTEE.  
To Building Contractors.

**TENDERS are invited for the Erection of a Council School in Leigh Road, Washwood Heath Birmingham.**

Applications for forms of tender and bills of quantities may be made on or before January 4, 1908, in the Finance Office of the Education Department, Edmund Street, Birmingham, accompanied by a deposit of £2, for which a receipt will be given, and the amount of the deposit will be returned after the Committee's decision, provided that the tenderer shall have sent in a bona-fide tender, and shall not have withdrawn the same. The drawings may be seen on and after the same date in the Architect's Office at the Education Department.

The Education Committee does not bind itself to accept the lowest or any tender, nor will the committee pay any cost incurred in tendering.

All workpeople engaged on any part of the work, whether sublet or otherwise, shall be paid not less than the minimum standard rate of wages current in the district in which the work or works may be constructed or executed, and no work shall be sublet to persons not paying at least the minimum standard rate of wages in the said district. The tender of any person or firm paying to their workpeople less than the minimum standard rate of wages current in the district will not be accepted.

Tenders must be delivered in sealed envelope, addressed to the undersigned, not later than Twelve noon, on Tuesday, January 21, 1908, endorsed "Tender for Council School, Leigh Road, Washwood Heath."

JNO. ARTHUR PALMER,  
Secreta

Education Department, Edmund Street:  
December 13, 1907.

## COMPETITION.

ILFORD EMERGENCY HOSPITAL.

**THE Governors invite Architects to compete in the preparation of Plans for the erection of this Hospital.**

Premiums amounting to £150 offered. Conditions and plan of site will be forwarded to any Architect on receipt of £1, which sum will be returned at the close of the competition, after the selection has been made.

The site adjoins Newbury Park Station (on the Great Eastern Railway Company's Ilford-Woodford Line) and may be viewed by arrangement.

All communications (written only) to be addressed to B. HENDERSON, Hon. Secretary, 24 Mansfield Road, Ilford, Essex.
